3 Auditory Sensations and Perceptions
- Introduction
- Loudness
- Perceived Noisiness
- Complex Spectral and Temporal Factors
- Tonal Aspects
- Durational Aspects
- Background Noise for Judgment Tests
- Perceived Noisiness of Impulses
- Round-Robin Study of Loudness of Impulses
- Accuracy of Different Procedures for Estimating Loudness and Noisiness
- Summary
- References

4 Normal Hearing, Sociocusis, Nosocusis, and Hearing Loss from Industrial Noise
- Introduction
- Methods of Measuring Hearing Level
- Assessment of Presbycusis, Sociocusis, and Nosocusis
- Analysis of Data for Noise-Exposed and Control Groups
- Synthesis Function for NIPTS
- Distributions of Percentile Presbycusis and NIPTS

5 Derivation of a General Theory and Procedure for Predicting Hearing Loss from Exposure to Sound
- Introduction
- Equal- and Effective-Energy Models for Predicting NIPTS
- Response Characteristics of the Ear to Stimulation
Recovery Characteristics of the Ear and Modifications of Model .................................................. 193
TTS in Humans from Interrupted Steady Noises ................................................................. 201
NIPTS from Interrupted Steady and Impulsive Industrial Noises ........................................... 206
TTS and Predicted NIPTS from Gun Noise ............................................................................... 213
Behavioral and Evoked Potential Thresholds of Hearing in Animals ....................................... 229
TTS and NIPTS in Animals from Impulsive and Nonimpulsive Noise ...................................... 246
Prediction of Equal TTS\textsuperscript{2} and NIPTS by $EE_A$ ...................................................... 256
Bandwidth and Spectra as Factors in TTS and NIPTS .............................................................. 264
Effective Quiet, Effective Everyday Noise, and Sociocusis ....................................................... 266
Summary of the $EE$ Procedure for Predicting NIPTS and TTS .............................................. 275
Physiological Studies of the Cochlea ......................................................................................... 277
References ................................................................................................................................. 281
Selected Bibliographies ............................................................................................................. 287

6 Speech Intelligibility in Quiet and in Noise
Introduction .............................................................................................................................. 291
Physical Characteristics of the Speech Signal ........................................................................... 292
Effects of Message Set, Noise, Vocal, and Binaural Variables on Speech Intelligibility ............ 301
Ameliorating the Effects of Noise on Speech Intelligibility ...................................................... 311
Predicting Intelligibility from Acoustical Measures of Speech, Noise, and Hearing Levels:
Articulation Index .................................................................................................................... 320
References ................................................................................................................................. 332

7 The Assessment of Hearing Handicap and Damage Risk from Noise
Introduction .............................................................................................................................. 336
Definitions of Hearing Handicap, Impairment, and Disability .................................................. 337
Pure-Tone Hearing Levels and Speech Audiometry .................................................................. 340
Summary of Correlations between Hearing Levels and Speech Tests ..................................... 351
“New” Objective and Subjective Data Relevant to the Evaluation of Hearing Handicap .......... 354
Intensities of Speech and Noise in Everyday Situations ............................................................ 354
Calculation of Articulation Index and the Intelligibility of Everyday Speech ............................ 355
Hearing Difficulties, Handicap, and Deafness in Real-Life Situations (Self-Ratings and Task Errors) ........................................ 360
Relations between Different Combinations of Hearing Levels .................................................. 374
Comparison of Proposed and AAO Guides for the Evaluation of Hearing Handicap for Everyday Speech ........................................................ 376
Comparison of Assessments by Different Procedures of Risks and Hearing Damage and Handicap .......... 379
References ................................................................................................................. 385

8 Mental and Psychomotor Task Performance in Noise

Introduction .................................................................................................................. 389
Physiological Variables ......................................................................................... 392
Task Variables ........................................................................................................ 400
Aftereffects ............................................................................................................ 411
Information Overload ............................................................................................ 415
Ancillary Variables ................................................................................................. 420
Industrial Field Studies ......................................................................................... 422
Summary ................................................................................................................ 427
References .............................................................................................................. 428

9 Nonauditory System Responses to Sound and Noise and Relations to Health

Introduction .................................................................................................................. 435
Nonauditory Systems and Their Responses to Sound .................................................. 435
Laboratory Studies of Humans and Monkeys .............................................................. 438
Laboratory Studies of Lower Animals ........................................................................ 456
Effects on Nonauditory Sensory Systems ................................................................... 465
Effects of Nonaudible Acoustic Energy ...................................................................... 472
Studies of Sleep Disturbance .................................................................................... 483
Nonauditory System Health Disorders ......................................................................... 509
Long-Term Exposures to Industrial Noises ................................................................. 512
Health-Related Effects in Residential Communities .................................................. 525
Aircraft Noise and Admission Rates to Psychiatric Hospitals ...................................... 526
Other Health Disorders Associated with Aircraft Noise ............................................ 536
References .............................................................................................................. 554

10 Community Reactions to Environmental Noise

Introduction .................................................................................................................. 568
Methodology of Attitude Surveys of Noise Annoyance .................................................. 573
Annoyance from Aircraft and Ground-Based Vehicle Noise ........................................ 581
Acoustical and Non-noise Factors in Noise Annoyance ........................................ 600
Impulsive and “Special” Environmental Noises ........................................ 614
Complaint Reactions to Environmental Noise ........................................ 618
House Depreciation Due to Environmental Noise ........................................ 620
Effects of Environmental Noise on Performance in Schools ........................................ 624
Additional Research Questions Concerning $L_{dn}$ ........................................ 627
Possible Modifications of $L_{dn}$ ........................................ 637
Summary of Overall Impacts of Environmental Noise and Specifications of Compatibility with Residential Areas ........................................ 648
References ........................................ 654

Index ........................................ 661
