## Preface

### 1 Introduction

1.1 Introductory remarks

1.2 Context

1.3 Basic mathematical concepts of reliability

1.4 Non-repairable systems

1.5 Repairable systems

1.6 Alternative models for the reliability of systems

1.7 Quality control and improvement and reliability

1.8 Statistical inference of reliability parameters

1.9 Monte Carlo methods

1.10 Contents of this book

References

### 2 Markov and Semi-Markov Models as a Basis for the Mathematical Analysis of System Reliability

2.1 Review of some relevant probability concepts

2.2 Markov processes

2.3 Semi-Markov process (SMP)

2.4 Markov models of systems with discrete events

2.5 Semi-Markov models of systems with discrete events

2.6 Important special cases

References

### 3 Methods for Investigating Homogeneous and Non-homogeneous Point Processes (Event Flows)

3.1 Point processes

3.2 Ergodicity

3.3 The $k$-intensity of the point process

3.4 Equilibrium equations

3.5 Application to semi Markov processes

3.6 Further ergodic relations

3.7 Regenerative models for failure flows

3.8 The main reliability parameters via point process parameters

References

### 4 Fault Trees — the Current State of Research

4.1 Introduction

4.2 Main definitions and notations

4.3 System reliability analysis using fault trees

4.4 Probability evaluation of fault trees

References
## CONTENTS

4.5 Fault tree evaluation based on minimal cut sets 84  
4.6 Problems arising in cut set evaluation for large fault trees 88  
4.7 A multi-level representation of a fault tree containing replicated gates 89  
4.8 Description of gate and component types 96  
4.9 FAMOCUTN — analytical evaluation of main module cut sets 96  
4.10 Examples 103  
References 107  
Bibliography 109

5  **Theory of Redundant Systems** 111  
5.1 Preliminary remarks 111  
5.2 Finite variates analysis 112  
5.3 Busy period analysis: analytical expressions 113  
5.4 Small parameter analysis of busy period variables 118  
5.5 Failure probability within a busy period through hyper-Erlangian approximation 125  
5.6 Time-varying reliability parameters via busy period parameters 128  
References 130  
Bibliography 132

6  **Monte Carlo Methods** 133  
6.1 Random variable generation 133  
6.2 Modelling of a non-homogeneous poisson process 140  
6.3 Modelling of a Markov chain in continuous time 141  
6.4 Modelling of semi-Markov processes 141  
6.5 Accuracy of estimators and the necessary number of realisations 143  
6.6 Applications to reliability problems 148  
References 152  
Bibliography 153

7  **Reliability Analysis using Perturbation Methods** 155  
7.1 Introductory remarks 155  
7.2 The problem for Markov reliability models 158  
7.3 Light traffic limits 160  
7.4 Phase-type and matrix-exponential approximations 162  
7.5 Infinitesimal perturbation analysis 164  
References 167  
Bibliography 167

8  **Stiff Processes in Reliability Analysis** 169  
8.1 Introduction remarks 169  
8.2 Small parameters in differential equations (regular case) 170  
8.3 Small parameters in differential equations (singular case) 172  
8.4 The saddle point method 174  
8.5 Asymptotic aggregation of states of semi-Markov process 176  
8.6 Models of processes in different scales 181  
8.7 Use of the invariance principle 186  
8.8 Some techniques for the introduction of a small parameter into stochastic relations 186
