List of the most frequently used symbols and abbreviations .....	XVI

## Part I

### Stationary Contacts

§ 1. Introduction. A simplified summary of the theory of stationary electric contacts .....	1
§ 2. The contact surface .....	8
§ 3. The contact resistance. General theory .....	10
§ 4. Calculation of constriction resistances with constant resistivity .....	13
Problem A. 14. — Problem B. 15. — Problem C. Elliptic a-spot. 15. — Problem D. Circular a-spot. 16. — Problem E. 18. — Problem F. The influence of the elliptic shape of the contact area on the constriction resistance expressed by a shape factor. 18.	
§ 5. Constriction resistances when conditions deviate from those in § 4, but with $\rho$ still being a constant .....	20
Problem A. Spreading resistance. 20. — Problem B. Constriction resistance when the a-spot is covered with a film. 21. — Problem C. Metallic contact with many a-spots. 22. — Problem D. The constriction resistance $R(n, a, l)$ of a coherent contact area with $n$ insulating spots. 24. — Problem E. Distorted constriction. 24.	
§ 6. Thermal constriction resistance .....	25
§ 7. Films on contacts .....	27
A. Different types of films. 27. — B. Aging of contacts. 31. — C. Tunnel resistance of contact films. 32.	
§ 8. The contact surface as a function of load and elastic as well as plastic properties of the members .....	33
A. Elastic deformation. 33. — B. Plastic deformation. 34. — C. Influence of temperature and contact duration on the contact area. 37.	
§ 9. The relation between contact load and resistance, particularly at moderate and high load .....	39
A. Introduction with description of Fig. (9.01). 39. — B. Crossed rod contacts. 42. — C. Explanation of the dashed lines in Fig. (9.01). 44. — D. Diversified measurements. 45. — E. Use of diagram (9.01) in practice. 46. — F. Contact preloaded with a high $P$ . 47.	
§ 10. Contact resistance on freshly cleaned contacts at very small contact loads	48
§ 11. The inductance of a current constriction. Skin effect .....	52
A. Inductance. 52. — B. The skin effect. 54.	
§ 12. Electrodynamic repulsion in a symmetric contact of a non-magnetic material .....	55

§ 13. The capacitance of a contact. Electrostatic attraction in a contact . . . . .	56
Example A. Crossed rod contacts. 57. — Example B. Quasiflat contacts. 58. — Example C. JOHNSON-RAHBEK effect. 58.	
§ 14. Measurement of the load bearing contact area. . . . .	59
§ 15. The relationship between electric potential and temperature in a current constriction which is symmetric with respect to the contact surface; that is, the $\varphi$ - $\theta$ relation . . . . .	65
§ 16. The $\varphi$ - $\theta$ relation in cases of dissymmetry . . . . .	70
Case A. Dissymmetry in regions of the constriction which are distant from the contact. 70. — Case B. Contact between highly different materials. 71. — Case C. Contact between moderately different metals. 72. — Case D. Heat enters across $A_0$ . 72. — Case E. THOMSON effect is present. 73. — Case F. The $\varphi$ - $\theta$ relation in the environment of a bimetallic contact. 75.	
§ 17. KOHLER effect . . . . .	75
§ 18. The influence of the JOULE heat on constriction resistance . . . . .	78
Example A. WIEDEMANN-FRANZ-LORENZ law is valid. 80. — Example B. Semi-conducting material. 82. — Example C. Heat flowing across $A_0$ . 82. — Example D. Independent of whether WIEDEMANN-FRANZ-LORENZ law is valid. 84.	
§ 19. Distribution of the temperature in a symmetric constriction with circular contact surface at given current . . . . .	85
Example A. $\rho$ and $k$ are constant. 85. — Example B. Corresponding to Example A in § 18. 86. — Example C. Corresponding to Example B in § 18. 86.	
§ 20. Temperature distribution in the constriction of a contact with circular contact surface and members with very different conductivities . . . . .	87
Example A. 88. — Example B. 89.	
§ 21. Resistance — voltage characteristics of clean symmetric contacts. Softening and melting voltages . . . . .	90
§ 22. Development of the temperature in a current constriction . . . . .	95
A. Introduction. 95. — B. Remarks concerning the diagrams. 98. — C. Moving contact. 101. — D. Temperature development in a cylinder. 103. — E. Cooling of a previously heated contact region. 104. — F. Examples. 104.	
§ 23. The growth of tarnish films on metals . . . . .	105
A. Fundamentals of the theory. 105. — B. Passivating films. 110. — C. Tarnishing of various base contact materials. 110. — D. Tarnishing of noble metals. 115.	
§ 24. Water films, local cells and rusting . . . . .	116
A. Thickness of water films. 116. — B. Rusting by means of electrochemical attack. Local cells. 117.	
§ 25. Thermoelectric effects . . . . .	118
§ 26. Observations on the tunnel effect . . . . .	121
A. Introduction. Method. 121. — B. Observations giving $\sigma$ . 125. — C. Measured $\sigma$ compared with the theoretical value. 127. — D. Super conductivity of contacts. 128.	

§ 27. Fritting of tarnish films .....	130
A. Introduction. 130. — B. A-fritting. General appearance of the process. 131. — C. Cessation voltage of fritting. 132 — D. The frit bridges. 137. — E. B-fritting. 139. — F. The coherer. 141. — G. Defritting. 141. — H. Initial stage of fritting. 141. — I. Recent investigations of fritting. 142.	
§ 28. <i>RU</i> -characteristics of contacts with thin alien films .....	146
§ 29. Adherence in dry contacts which are not heated to any influential extent by the current .....	150
§ 30. Adherence in contacts that are heated by the current passing through them. Resistance welding .....	154
§ 31. About stationary contacts in practice. ....	158
A. General survey of the role that contact films play in practical contacts. 159. — B. Measurements in F. L. on contacts made without impact or sliding. 162. — C. Clamped contacts. Screw. 165.	
§ 32. Dimensioning a contact with respect to its heating .....	169
§ 33. Contact effects in carbon microphones .....	172
§ 34. Contact noise in a stationary contact .....	183
§ 35. Contact with semiconductors. Rectification. Transistors. Static electrification .....	188
A. Introduction. 188. — B. Contact between a metal and a semiconductor and its rectifying property. 188. — C. The <i>p-n</i> -junction. 190. — D. Types of semiconducting rectifiers. 191. — E. Remarks about transistors. 194. — F. Remark concerning the contact between silicon carbide crystals. 195. — G. Static electrification. 195.	
§ 36. Carbon-pile rheostats. Electric resistance of pressed powders .....	196

## Part II

## Sliding Contacts

§ 37. Survey concerning friction and wear .....	199
A. Introduction. 199. — B. The friction work resulting from plastic deformation. 200. — C. The adherence term of the friction. 201. — D. The increase of the contact area during sliding. 203. — E. Coulombs law of friction. 204. — F. About the characteristic value of $\mu \approx 1$ on freshly cleaned metal contacts in air. 205. — G. Friction in bimetallic contacts. 206. — H. Friction between non-conducting members. 207. — I. Devices for the investigation of friction. 207. — J. Rolling friction. 207. — K. The influence of adhesion wear on friction. 209. — L. The work of the adhesion friction. 209.	
§ 38. Early observations on the high friction in clean metallic contacts in vacuum, and the influence of admitted gases .....	210
§ 39. Boundary lubrication .....	212
A. Features of boundary lubrication. 212. — B. Discussion of two competing theories of boundary lubrication. 216. — C. Lubricating practice. 221. — D. Beilby layer. 221. — E. Properties required of bearing materials. 222. — F. Ball bearings. 224.	

§ 40. Theory of friction and wear on carbon contacts. Lubrication by means of solid lubricants as graphite and molybdenum disulphide . . . . .	224
A. Introduction. 224. — B. Friction of carbon brushes as dependent on the orientation of graphite basal planes. 226. — C. High altitude effect on brush wear. 227. — D. Adjuvants. 229. — E. Graphite and molybdenum sulfide powder as lubricant. 229.	
§ 41. Measurements on specific friction force . . . . .	231
§ 42. Stick-slip motion. The temperature in currentless sliding contacts . . . . .	234
A. Stick-slip or jerky motion. 234. — B. The temperature in currentless sliding contacts. 235.	
§ 43. Statistical study of the electric conduction and the friction of sliding contacts. Radio-noise in sliding contacts . . . . .	237
§ 44. Friction wear in metallic contacts without current . . . . .	242
A. Introduction. 242. — B. Size and frequency of wear fragments appearing during periods of adhesive wear. 243. — C. Details of the formation of wear detritus. 244. — D. Why liquids, even the deposit from air humidity, are able to influence wear without greatly affecting the friction coefficient. 245. — E. The work necessary to break off a wear fragment. 245. — F. Formula for classification of types of friction wear. 246. — G. Friction wear in currentless sliding contacts represented by $2 \cdot 10^5 Z$ , which is calculated employing the hardness, $H$ , of the softer member. 248. — H. Wear in sliding contacts of measuring apparatus. 253.	
§ 45. Electrical performance of carbon brushes on rings and commutators when arcing is excluded . . . . .	254
A. Introduction. 254. — B. Early investigations on the dark collector film. 255. — C. Chemical analysis of the collector film. 259. — D. Structure of the film. 259. — E. Oscillographic investigations of frittings of the collector film. 259. — F. More about the film generation particularly in the "static" state. 262. — G. Two brushes in the same track. 264.	
§ 46. The temperature in a contact between a carbon brush and a copper ring or commutator . . . . .	265
A. Introduction. 265. — B. Supertemperature of the contact surface above the temperature of the bulk of the ring. 266. — C. The temperature in the hottest section of the brush. 267.	
§ 47. Wear and friction in the brush-ring contact . . . . .	269
A. Introduction. 269. — B. Influence of the current on the wear in absence of arcs. 269. — C. Numerical data of brush qualities. 272. — D. Abrasion of the slip ring. 273. — E. Wear in the brush-commutator contact in case of arcing. 274. — F. Friction between an electrographite brush and copper ring. 275.	
§ 48. Commutation problems . . . . .	276
A. Introduction. 276. — B. Computation of cardinal conditions for good commutation. 279. — C. Arcing. 281. — D. Numerical example referring to a d-c generator with 2 poles for about 50 amp. 283. — E. Brush contacting several segments simultaneously. 284. — F. So-called short-circuit currents in the brush. 285. — G. The importance of the elasticity of the brush for the commutation. 287. — H. The appropriate value of the emf $V$ to be induced in an armature winding by the field of the interpoles. 288.	
§ 49. Current collectors for trolley cars . . . . .	288

## Part III

## Electric Phenomena in Switching Contacts

§ 50. Definitions and high power breakers .....	290
A. Introduction. 290. — B. Breaking of a-c 290. — C. Vacuum switches. 292. — D. Direct current switches. 292. — E. Quenching circuits. 293. — F. Material transfer at switching. 293.	
§ 51. Ignition of arcs in switches .....	293
A. Introduction. 293. — B. Electric breakdown in the gap between clean metallic electrodes at atmospheric pressure. 293. — C. Ignition of an arc in a closing contact. 295. — D. Drawn arcs. Floating. 297. — E. Reignition of the arc. 299.	
§ 52. Discharge transients .....	302
§ 53. VI-characteristics of the stationary arc in air, and their use for calculating the duration of short arcs .....	304
A. Introduction. 304. — B. Observations on breaking contacts. 304. — C. The use of VI-characteristics for determination of arc durations. 310. — D. Simplified VI-characteristics in normal atmosphere. 311. — E. Determination of $I_m$ and $V_m$ by aid of one oscillogram and Diagr. XI. 314. — F. Use of the resistance line together with arc-characteristics for the problem of how a constant current is shared between an arc and an ohmic resistance both in parallel. 314. — G. Survey of the method of applying the resistance line together with arc characteristics. Condition of stability. 315. — H. Semiconducting resistors parallel to the arc. 315. — I. Vacuum arc. 316.	
§ 54. Electric Oscillations generated by d-c arcs .....	316
§ 55. Bouncing .....	318
§ 56. Mechanical erosion and tarnishing phenomena that are typical for sliding and switching contacts .....	321
A. Introduction. 321. — B. Mechanical material transfer. 322. — C. Catalytic effects in switching contacts. 323. — D. Frictional oxidation. 323. — E. Oxidation in the arc. 324.	
§ 57. Methods to suppress or minimize arcing during switching .....	326
A. Introduction. 326. — B. Quenching by means of a resistor. 326. — C. Capacitive quenching. 327. — D. Arc quenching in the contact rectifier. 328. — E. Weakening of the arc between barriers, magnetic blowout. 329. — F. Motion of an arc in a magnetic field. 330.	
§ 58. Arc duration in contact making with voltage below 200 to 300 volts ...	331
A. Introduction. 331. — B. Calculations with respect to the wiring Diagram (58.02) with initially charged capacity. 331. — C. Inductance $l=0$ , and consequently $\beta=0$ in the circuit (58.02). 334. — D. Floating. 335. — E. Empirical formula for $t_a$ , the life of the arc, in the circuit (58.02). 336. — F. Battery instead of $C$ , equivalent to $C = \infty$ . 337.	
§ 59. Arc duration on breaking contact. Single circuit .....	338
A. Ohmic circuit according to wiring diagram of Fig. (59.01). Operation in air. 338. — B. Ohmic circuit. Operation in a vacuum. 338. — C. Inductive circuit according to wiring diagram in Fig. (59.04). Capacity of the leads neglected. Operation in air. 338. — D. The quantity of electricity, $q$ , that flows through a drawn arc with the life time $t_a$ . 341. — E. Influence of the capacity of the leads. 342.	

§ 60. Arc duration and other phenomena in an arc quenching circuit according to wiring Diagram (60.01) .....	342
A. General equations for the quenching circuit when quenching an arc on breaking contact: $r$ in position $a$ . 343. — B. Case of $V_a \approx$ constant. 343. — C. $V_a \approx V_m$ and arc current $I_a$ considerably greater than $I_m$ . 344. — D. $V_a$ differing slightly from $V_m$ , and the short circuit current, $I_k$ , lying in the range between $I_m$ and a few amp. 345. — E. Note concerning the position of $r$ . 347. — F. Empirical formula for the calculation of the arc life at constant opening velocity of the circuit of Fig. (60.01) under such conditions that the arc generates oscillations. 347. — G. Condition for no breakdown of the gap between the separating electrodes. 349. — H. Calculation of the voltage $V_s$ between the electrodes as function of the time, $t$ , in case of no arc. 350.	
§ 61. Quenching of arcs by resistance parallel to the operating contact or parallel to the inductive coil .....	352
A. Quenching with $r$ in position $a$ . 352. — B. Arc quenching with $r$ in position $b$ . 354.	
§ 62. Distinct types of arcs in relay contacts .....	354
A. Introduction. 354. — B. The power balance in the short arc determines the prevalence of the evaporation from the anode. 355. — C. The plasma arc. 356. — D. Remarks. 357.	
§ 63. Material transfer in switching contacts .....	358
A. Definition of the major types of material transfer. 358. — B. Material transfer at contact opening. 359. — C. Material transfer at contact make. 363.	
§ 64. Measurement of the material transfer in switching contacts, particularly with normal electrodes .....	363
A. Introduction with definition of electrode types and symbols. 363. — B. Determination of the amount of material transfer that is produced by plasma arcs between normal electrodes. 364. — C. Method to determine $\omega_a$ and $\omega_c$ in general. 365. — D. Measurements of bridge transfer in opening contacts. 366. — E. Determination of the coefficient $\gamma_s$ , which according to Eq. (63.10) characterizes the material transfer in short arcs between normal electrodes. 368. — F. The final length, $s_m$ , of the short arc. 370. — G. Abnormal, short arcs with zero or a small material transfer from the anode. 371. — H. The amount of material transfer during floating. 372. — I. The disintegration of the cathode in glow discharges. 373. — J. Material transfer at contact closure without bouncing. 374.	
§ 65. Bridge material transfer in the shape of pips and spires .....	375
§ 66. Theory of the electric material transfer in switching contacts. History of this theory .....	376
A. History. 376. — B. Explanation of the material transfer caused by the arc. 378. — C. Present theory of the bridge transfer. 379. — D. THOMSON effect. 379. — E. Peltier effect. 383. — F. KOHLER effect. 384. — G. Comparison between calculated and observed magnitudes of the bridge transfer. 388.	
§ 67. Numerical example on the calculation of material transfer for a silver contact with capacitive arc quench .....	387
§ 68. Mercury switches .....	388

§ 69. Application of statistics to surety of contact make .....	390
A. Introduction. 390. — B. Testing surety of contact make with single macro contacts. 391. — C. Effect of twin contacts. 393.	
§ 70. The choice of contact material and contact shape for practical applications .....	394
A. Permanent contacts. 394. — B. Micro contacts. 394. — C. High repetitive operation relay contacts. 395. — D. Light duty relays for medium frequencies. 396. — E. Medium duty circuit breakers and contactors. 396. — F. Heavy duty circuit breakers with up to thousands of amperes and volts. 396. — G. Sliding contacts for resistors and apparatus. 397. — H. Remark about non-welding in carbon and wolfram-carbide contacts. 397.	

## Part IV

## History

§ 71. History of early investigations on contacts .....	398
A. Contact resistance. 398. — B. Microphone and coherer. 401. — C. Current constriction. 405.	

## Appendices

§ I. Hardness, strain hardening, atomic diffusion phenomena as recovery and creep .....	407
A. Survey of the theory of plastic deformation of solid bodies and of diffusion phenomena. 407. — B. Hardness as defined by the ball indentation test. 410. — C. Brittle materials. 413. — D. The work consumed by a plastic deformation. 414.	
§ II. Electronic conduction in solids .....	414
A. Energy band scheme. 414. — B. Distribution of the electrons on the energy levels of a band, with special reference to the conduction band of a metal. 416. — C. Potential barrier. Thermionic emission of electrons. 419. — D. Addenda about $\eta$ , $n$ - and $p$ -conduction. 420. — E. Semiconduction. 421. — F. Potential barriers and equilibrium conditions in contacts. 424. — G. The thermal conductivity, $k$ , and the law of WIEDEMANN, FRANZ and LORENZ. 428.	
§ III. Tunnel effect. Thermionic emission and field emission .....	429
A. Theoretical basis for the calculations. Classes I and II of calculation procedure. 429. — B. Field emission and thermionic emission enhanced by the SCHOTTKY effect. 433. — C. Tunnel resistivity. 435. — D. Comparison between tunnel current and thermionic current according to formula (III,13). 437. — E. Tunnel effect when both electrodes are of the same semi-conducting material. 438. — F. Remark concerning the field strength. 439. — G. Tunnel current across a gap that surrounds a metallic contact consisting of a circular spot with the radius $a$ . 439.	
§ IV. Structure, electric and thermal conductivity of carbons .....	440
A. Introduction. Graphite lattice. 440. — B. Carbon grades. 442. — C. Graphitization. 443. — D. Electric conductivity of carbons. 444. — E. Heat conductivity of carbons. 447.	
§ V. Hydrodynamic or thick film lubrication .....	448

§ VI.	Remarks about threadlike metallic formations . . . . .	453
§ VII.	Some fundamental formulas concerning the electric discharge . . . . .	455
	A. Introduction. Kinetic fundamentals. 455. — B. Drift velocity. 456. —	
	C. Thermal ionization. Saha's equation. 457. — D. Plasma. 457. —	
	E. Current in vacuum restricted by the space charge of the current carriers. 458.	
§ VIII.	General theory of the arc that appears in relays . . . . .	459
	A. Introduction. 459. — B. Reminder of elements of the theory of electric discharges in gases. 460. — C. Thickness of the cathode layer and metal vapor pressure within it. 462. — D. Definition of the examples. 463. — E. Current density $J_+$ of the positive ions and $J_e$ of the primary electrons, at the cathode. 465. — F. $h$ as a function of $T$ and $p$ . 465. — G. Comparison with measurements. 467. — H. Power balance at the cathode. 467. — I. Summary of the results concerning cathode phenomena in arcs between non-refractory electrodes. 469. — J. The power balance at the anode. 470. — K. Cathode of refractory materials as carbon and wolfram. 471. — L. Why is the voltage of a short arc of the order of 10 V? 471. — M. Movement of the arc spot. 472. — N. Current-voltage characteristics of arcs. Arc life. 473.	
§ IX.	Calculation of the size of the load bearing area and of the pressure on it in experiments by BOYD and ROBERTSON [1] . . . . .	475
§ X.	. . . . .	476
§ XI.	. . . . .	481
	Author and literature index . . . . .	483
	Subject index . . . . .	514
