DESIGN CONSIDERATIONS FOR A WIDE-BAND OSCILLOSCOPE TUBE WITH SCAN MAGNIFICATION*)

BY

E. E. HIMMELBAUER

Promotor: Prof. Dr Ir J. C. Francken.
Coreferent: Dr J. L. Verster.

Philips Res. Repts Suppl. 1969 No. 1
6. THE PRE-FOCUSING SYSTEM
   6.1. General considerations
   6.2. The choice of the pre-focusing system
   6.3. The properties of a pre-focusing system consisting of two crossed quadrupole lenses
   6.4. The products of the magnification factors in the thin-lens approximation

7. A PRACTICAL DESIGN EXAMPLE
   7.1. Introduction
   7.2. Considerations concerning the optimum scan-magnification factor
   7.3. The construction of the pre-focusing system
   7.4. The construction of the scan-magnifier lens
   7.5. Application of the thin-lens approximation

8. THE DETERMINATION OF THE POTENTIAL FIELDS OF THE LENSES
   8.1. General remarks
   8.2. Analytical solution for the potential field of the pre-focusing system
   8.3. Calculation of the potential field of the pre-focusing system by means of the numerical solution of the Laplace equation
   8.4. Electrolytic-tank measurements of the potential distribution of the scan-magnifier lens

9. THE CALCULATION OF PARAXIAL ELECTRON TRAJECTORIES
   9.1. Paraxial trajectories of the pre-focusing system
   9.2. Paraxial trajectories of the scan-magnifier lens
   9.3. The paraxial properties of the complete focusing system

10. THE EFFECT OF LENS ERRORS
    10.1. Introduction
    10.2. General notes about lens aberrations
    10.3. Considerations of fourth-order terms of electrostatic fields with two planes of symmetry
    10.4. Derivation of the third-order aberration coefficients for the scan-magnifier lens
    10.5. The derivation of simplified expressions for the aberration coefficients
