## CONTENTS

I. General introduction

I.1. A short history of the hot-gas engine ........................................... 3
I.2. The principle of the Stirling engine ........................................ 7
I.3. Drive mechanisms used in displacer-piston engines ...................... 12
References .................................................................................. 16

II. Analysis of the rhombic drive mechanism ......................................... 17

II.1. Symbols ................................................................. 17
II.1.1. Symbols for the general form ........................................ 17
II.1.2. Symbols for the special form ....................................... 18
II.2. Balancing ........................................................................ 26
II.2.1. Introduction .................................................................. 26
II.2.2. The balancing conditions for the general form .................. 27
II.2.3. The balancing conditions for the special form .................... 32
II.3. The determination of various quantities from the dimensions of the drive mechanism ................................................................. 35
II.3.1. Introduction .................................................................. 35
II.3.2. S, \( \varphi_T \) and \( \chi_{\text{max}} \) ......................................... 36
II.3.3. The volume of the expansion space, \( V_E \) ....................... 38
II.3.4. The volume of the compression space, \( V_C \) ..................... 39
II.3.5. \( V_0 \), \( w \), \( \varphi_{\text{ve}} \) and \( \alpha \) ............................................. 42
II.3.6. Summary of the equations derived above ......................... 42
II.4. The pressure variation in circuit and buffer space ....................... 44
II.4.1. The pressure variation in the circuit .................................. 44
II.4.2. The pressure variation in the buffer space of a multi-cylinder engine ................................................................. 45
II.5. The torque on the crankshafts due to the gas forces and inertia forces .... 46
II.5.1. Introduction .................................................................. 46
II.5.2. The energy balance .......................................................... 47
II.5.3. The torque on one crankshaft due to the gas forces of the circuit and crankcase on the piston and the displacer .................. 48
II.5.4. The torque on one crankshaft due to the gas forces of the buffer space acting on the first piston of a multi-cylinder engine .... 50
II.5.5. The torque on one crankshaft due to the inertia forces .......... 50
II.6. The forces on various parts of the drive mechanism due to gas forces and inertia forces ................................................................. 54
II.6.1. Introduction .................................................................. 54
II.6.2. The forces on the piston drive mechanism ......................... 54
II.6.3. The forces on the displacer drive mechanism ....................... 57
II.6.4. The forces on the crankshaft ............................................. 57
II.6.5. Simplified equations for the forces ..................................... 58
II.7. The power and the torque due to the friction on one crankshaft .... 59
II.8. Some applications of the torques calculated above .................... 62
II.8.1. Introduction .................................................................. 62
II.8.2. Motion of the crankshafts ............................................... 62
II.8.3. The torque on the gearwheels ........................................... 66
II.8.4. Determination of the size of the flywheels ......................... 67
II.8.5. Motion of the driven machine ......................................... 68
II.8.6. The reaction force and reaction torque on the base ............. 69
II.9. Specimen calculation for a single-cylinder hot-gas engine

II.9.1. Nominal data and the determination of numerical quantities
II.9.2. The torque \( (T_t + T_f) \) for \( \omega = \) constant
II.9.3. The effective moment of inertia \( J_e \)
II.9.4. Calculation of the forces occurring in the system
II.9.5. An estimate of the torque \( T_f \) and the friction power \( P_f \)
II.9.6. Motion of the crankshaft
II.9.7. Motion of the driven machine (brake)
II.9.8. The torque on the gearwheels
II.9.9. The reaction torque on the base
