Chapter 1  Propagation and Velocity of Light

1.0  Introduction  1
1.1  The rectilinear propagation of light  1
1.2  Wavefronts and the vergence of light  4
   Vergence  5
   The sign convention  5
   The unit of vergence  6
   Examples  6
   Vergence and the curvature of wavefront  8
   Effectivity  9
   Aperture, radius of curvature, and sagitta  10
1.3  The formation of shadows  11
   Example  12
1.4  The pinhole camera  13
1.5  The velocity of light  14
   Fizeau's toothed-wheel experiment  15
   Michelson's rotating mirror experiment  16
   Bergstrand's method using the Kerr cell  16

Exercises  18

Chapter 2  Refraction at Plane and Curved Surfaces

2.0  Introduction  19
2.1  Refraction at plane surfaces  19
   The laws of refraction  20
   Refraction by Huygens' principle  21
   Refractive index  21
   Graphical ray tracing for refraction  22
   Refractive indices and reversibility of light  23
   Refraction by parallel sided layers of materials  25
   The refraction formula in its general form  26
   Formation of an image - real and apparent depth  28
   Change in wavefront curvature  31
   Total reflection and the critical angle  32
   Examples of total internal reflection  34
   Refraction by prisms, the mirage, and fibre optics  34
   Refraction by prisms  35
      Minimum deviation  38
      Total internal reflection  40
   Ophthalmic prisms  41
      The image formed by a prism  43
      Reflecting prisms  44
2.2  Refraction at curved surfaces  47
   Converging and diverging refracting surfaces  47
   Refraction by a single spherical surface  47
   The fundamental paraxial equation  48
   The optical sign convention  50
   The power of a refracting surface  51
   Reduced vergences  51
   Linear magnification of the image  52
   Focal lengths of a single refracting surface  55
   Newton's equations  58
   Graphical construction for images  60

Exercises  61

Chapter 3  Thin Lenses

3.0  Introduction  63
3.1  Spherical surfaced lenses  63
   Lens forms  63
   Lens specification  65
   Principal foci and focal lengths of a lens  67
   Formation of images by thin lenses  69
   Graphical construction of images  69
   Measurement of curvature by spherometer  77
   Measurement of power: the lens measure  77
   The effectivity of a lens  77
   The smallest separation of object and real image  79
   Newton's equations for thin lenses  80
   Two thin lenses in contact  81
   The prismatic effect of a thin lens  82
3.2  Sphero-cylindrical lenses  83
   The cylindrical lens  84
   The sphero-cylindrical lens  85
   The line foci and disc of least confusion  87
   The toric lens  88
   Two plano-cylindrical lenses in contact  89
      Worked example  91
   The equivalent sphere and cylinder  91
   The Stokes lens  93
3.3  Fresnel lenses and prisms

Exercises  94

Chapter 4  Lens Systems

4.0  Introduction
4.1  Simple lens system - two thin lenses in air  96
   Vertex power and vertex focal lengths  96
      Worked examples  99
   Principal points and equivalent power  100
      Positions of the equivalent thin lens  100
      Equivalent power and equivalent focal lengths  102
      Examples of principal planes of lens systems  102
   Object and image positions, and magnification  103
      Newton's formulae  103
      Step-along vergences  104
      The conjugate foci relationship  10
      The nodal points of a simple lens system  107
      The optical centre of a simple lens system  107
      Ray tracing using nodal points  108
   Unit planes  109
      Formulae for simple (two lens) systems  109
      The equivalent power  109
      The vertex powers  110
      The positions of the principal planes  110
      Methods of solution of problems  111
      Worked example  113
4.2  Thick lenses
   Surface powers and reduced thickness  115
   Thick lens formulae  116
   Focal points and principal points of a thick lens in air  116
Contents

4.2 Thick lenses (cont.)
   Examples of principal planes of thick lenses 117
   Object and image position and magnification 117
   Newton's formulae 118
   Conjugate foci relationship 119
   Step-along vergences 119
   Nodal points and optical centre of a thick lens 120
   The general case of a thick lens 121
   Formulae 121
   Nodal points and paraxial ray tracing 123
   Worked examples 124

4.3 Multirefracting systems 126
   The human eye and a schematic eye 127

4.4 Worked problems 128
   A system of three lenses in air 128
   A simplified 3-surface model eye 130
   A reduced model eye 132

Exercises 134

Chapter 5 Plane and Curved Mirrors

5.0 Introduction 136
5.1 Reflection of light at plane surfaces 136
   The laws of regular refraction 137
   Reflection of light waves by Huygens' principle 138
   Reversibility of a light ray 138
   The formation of an image by a plane mirror 138
   Reversion of an extended image in a plane mirror 139
   Summary of the characteristics of the image 139
   The sight-testing chart 140
   Worked example 140
   The minimum size of a plane mirror 141
   The rotation of a plane mirror 141
   Deviation by reflection at two inclined mirrors 142
   Images formed by inclined mirrors 143
   Multiple images in mirrors 144
   The thick mirror – Position of the bright image 144

5.2 Reflection of light at curved surfaces 145
   Types of spherical mirrors 145
   Reflection of pencil of rays which is parallel to the axis 145
   A wide aperture spherical mirror 145
   Narrow aperture spherical mirrors 146
   Forms of reflecting surface 146
   Focal length and radius of curvature 148
   Formation of images by spherical mirrors 148
   Graphical constructions 149
   Calculations for images 151
   Worked examples 152
   Power and vergences with mirrors 154
   Worked example 155
   Newton's equations 155
   Catadioptric systems – the equivalent mirror 156
   Vergence method in a catadioptric system 157
   Worked example 157

Exercises 159

Chapter 6 The Dispersion of Light and Colour

6.1 Introduction 160
6.2 Newton's prism experiments 161
6.3 Dispersive power and constringence 163
6.4 Prism combinations 166
   The direct vision spectroscope 166
   The achromatic prism 166
   Worked examples 167
   The irrationality of dispersion 168

6.5 Colour 169
   Characteristics of colour 169
   Coloured paper and coloured glass 170
   Colour addition 171
   Colour subtraction 172
   Colour filters 172
   Paints and pigments 173
   Other colour effects 173
   The trichromatic system of colorimetry 174
   Infrared and ultraviolet radiations 175

Exercises 176

Chapter 7 Aberrations

7.0 Introduction 178
7.1 Classification of aberrations 178
7.2 The chromatic aberrations 179
   Formulae for chromatic aberration 181
   Correction of chromatic aberration 182
   Two thin lenses in contact 182
   Two separated thin lenses 183
   Worked examples 184

7.3 The monochromatic aberrations 186
   Spherical aberration 187
   Spherical aberration and a single spherical surface 190
   Coma 191
   Oblique astigmatism 195
   Variation of oblique astigmatism 197
   The position of the tangential image 199
   The position of the sagittal image 200
   Oblique astigmatism for central refraction 200
   Curvature of field 202
   Distortion 204
   Ray tracing at spherical surfaces 207
   Young's graphical construction 207
   Dowell's graphical construction 207
   Trigonometrical ray tracing 208
   Worked example 210

Exercises 212
Chapter 8  The Principles of Optical Instruments

8.0 Introduction 214
8.1 Non-visual instruments 214
   The camera 214
   The f-number 214
   The camera lens 215
   The telephoto lens 216
   Depth of focus and depth of field 217
   The hyperfocal distance 219
   The projector and the enlarger 220
8.2 The eye 221
   The visual angle and retinal image size 222
8.3 Visual instruments 223
   The simple magnifier 223
      Nominal and maximum angular magnification 225
      Iso-accommodative magnification 226
      Worked examples 227
   Eyepieces 228
      The Huygens eyepiece 228
      The Ramsden eyepiece 229
   The microscope 230
      Worked examples 231
   The telescope 233
      The astronomical telescope 233
      The terrestrial telescope 235
         The terrestrial telescope with lens erecter 235
         The terrestrial telescope with prism erecter 235
      The Galilean telescope 236
      The reflecting telescope 237
      The Schmidt catadioptric system 238
   The spectrometer 238
      Measurement of the refractive index of a prism material 240
   The direct vision spectroscope 241
   The Abbe refractometer 242
8.4 Stops in optical instruments 243
   Iris (aperture stop) and field stop 244
   Entrance and exit pupils 245
   Worked example 247
   Field of view, entrance and exit windows 247
   Entrance and exit pupils with telescopes 249
   Field of view with telescopes 251
   Worked examples 253
8.5 The focimeter 254
   The basic principle of the focimeter 255
   The focimeter equation 255
   Movement of the target 256
   Power, prism and cylinder axis scales 257
   Determination of power and axis 259
   The focimeter filter 260
   Focusing the eyepiece 260
   Back vertex position error 260
   The projection focimeter 261
Exercises 262

Chapter 9  Photometry

9.0 Introduction 261
9.1 Visual sensitivity 261
9.2 Solid angles 266
9.3 The standard source and the candela 266
9.4 Working standards 267
9.5 Luminous flux 268
9.6 The luminous intensity of a source 269
   The mean spherical intensity of a source 269
9.7 Illuminance 270
9.8 The two fundamental laws of photometry 271
   Worked examples 272
9.9 Reflectance, transmittance, and optical density 273
   Reflectance 273
      Effect of a reflector on the illuminance of a surface 274
      Worked example 274
   Transmittance 275
      Effect of a transmission filter on illuminance 275
      Worked example 276
   Optical density 276
      Worked example 277
9.10 Luminance and brightness 278
   Uniformly diffusing surfaces 280
   The luminance of images 280
9.11 Photometers 281
   The Weber-Fechner law 282
   Visual photometers 283
      The grease-spot photometer 283
      The wax-block photometer 283
      The shadow photometer 284
      The Lummer-Brodhun photometer 284
      The flicker photometer 285
      The integrating photometer 286
   Non-visual (physical) photometry 287
      The photovoltaic cell 287
9.12 Luminous efficacy of a source 287
   Worked examples 288
Exercises 289

Chapter 10  Light Waves

10.0 Introduction 291
10.1 One-dimensional waves 292
10.2 Sinusoidal waves 293
   Introduction 293
   Sine waves 293
      Equivalent moving wave equations 294
      Examples 294
10.3 Phase and phase velocity 295
   Phase and initial phase 295
   Phase or wave velocity 296
Exercises 298
Chapter 16 Imagery
– spatial distribution of optical information

16.0 Introduction 461
16.1 Imagery 461
    Spatial frequencies – introduction 461
    Image filtering 463
    The cosinusoidal grating 463
    Square wave gratings 465
    Abbe’s theory of image formation 467
    Spatial filtering 469
    Phase objects and phase contrast 470
    Dark field or dark ground observation 473

16.2 Evaluating imaging systems 475
    The modulation transfer function 477
    Linear and angular spatial frequency 477
    Analysis of modulation transfer 479
    Defocus blur and the MTF in a reduced eye 481
    Spurious resolution 483
    MTFs, cut-off frequency, and Rayleigh’s criterion 484

16.3 The laser 485
    The first laser 485
    The helium-neon laser 486
    Laser applications 487
    Speckle patterns 488

16.4 Holography 489
    Continuous wave holography 489
    Pulsed laser holography 490
    Experimental difficulties 491
    The mathematics of holography 491

Exercises 492

Appendices

Appendix 1 Fourier analysis 494
Appendix 2 Useful trigonometrical identities 497
Appendix 3 Apparent displacement 498
    Deviation by a reflecting prism 498
    The fundamental paraxial equation 499
    Minimum separation of an object and real image 500
    The bright image in a thick mirror 500
    Conjugate foci formula for a spherical mirror 501
    Magnification formula for mirrors 502
    Hyperfocal distance 503
    Fermat’s principle 503
    The laws of reflection 503
    The laws of refraction 504

Appendix 4 Similar triangles 505
    Small angles 506
    Solid angles 506

Appendix 5 Definition of the candela 507

Appendix 6 Radiometry and photometry 508
    Introduction 508
    Inverse square law and cosine laws of irradiance 508

Appendix 6 Radiometry and photometry (cont.)
    Multiple point sources 509
    Extended sources 509
    Irradiance of an area $dA_2$ by a source of area $dA_1$ 510
    Lambert’s law 511
    Photometric quantities 511
    Luminous flux 512
    Luminous intensity and illuminance 512
    Luminance 512
    Luminous exitance 512
    Reflectance and transmittance 513
    The luminance of an optical image 514
    The luminance of an image projected onto a screen 515

Appendix 7 Curvature 516

Appendix 8 Step along and step back vergences 517
    Back and front vertex powers of a lens 518
    Equivalent power of a lens 519

Appendix 9 Spherical aberration 519

Index of Tables 520
