Optical Information Processing

Adolf W. Lohmann

Edited by Stefan Sinzinger

Universitätsverlag Ilmenau
2006
9 Nonlinear Transforms ............................... 87
  9.1 Graphical solution ............................... 87
  9.2 Polynomial Nonlinearity ........................ 88
  9.3 FM-Nonlinearity ................................ 89
  9.4 Hardclipping .................................... 89
  9.5 Amplitude height analysis ........................ 90

10 Schwarz Inequality ................................. 91

11 Sampling Theorem ................................ 93
  11.1 Properties of the SINC-Function ............... 93
  11.2 Sampling at Shifted Points ..................... 94
  11.3 Sampling of periodic functions ................ 95
  11.4 Sampling at the wrong interval ............... 98
  11.5 Sampling in two dimensions .................... 100
  11.6 Fourier transform by digital computation .... 101
  11.7 Large digital Fourier transform ............... 102

12 Fresnel-Transformation .......................... 105
  12.1 Definitions .................................... 105
  12.2 Shift-theorem .................................. 106
  12.3 Tilt-theorem ................................... 106
  12.4 Sampling theorem for Fresnel transform pairs .. 107

13 The Stationary Phase Integral ................... 111
  13.1 Fourier transform of the step-function ........ 111
  13.2 The Fresnel integral ........................... 112
  13.3 The method of stationary phase ............... 113
  13.4 Saddle-point method ............................ 116

14 What is Light? ..................................... 119
  14.1 History ......................................... 119
  14.2 What is Observable? ............................ 120
  14.3 The wave equation .............................. 121
  14.4 Complex representation of the wavefield ...... 122
  14.5 Frequency averages ............................. 125
  14.6 The envelope representation of complex signals 126

15 The Uncertainty Principle ......................... 129
  15.1 The usual derivation ............................ 129
  15.2 The uncertainty of some specific fields ....... 132
  15.3 Other definitions of $x$- and $\nu$—spreads .... 135
  15.4 Gabor's information cells ...................... 137

16 Fundamentals of Diffraction Theory .............. 141
  16.1 Terminology: diffraction and interference .... 141
16.2 History and classification of diffraction theories ........................................ 142
16.3 Kirchhoff-approximation .............................................................................. 143
16.4 The RSD theory of Fresnel diffraction .............................................................. 147
16.5 Derivation of the HFK-integral from the RSD-integral .................................. 152
16.6 The sampling theorem for FRS-diffraction .................................................... 156
16.7 Justification of Young’s Diffraction Theory (YMR) ...................................... 157

17 More About Evanescent Waves .................................................................... 163
17.1 Boundary conditions for $\vec{E}$ and $\vec{H}$; Fresnel coefficients ................. 163
17.2 A more abstract look at evanescent waves .................................................. 167

18 Fresnel Diffraction on Periodic Objects — The Talbot-Effect (1836) .............. 183
18.1 HFK-theory of the Talbot effect ..................................................................... 184
18.2 RSD-Theory of the Talbot effect .................................................................. 184
18.3 Plane wave theory of the Talbot effect ......................................................... 185
18.4 What are these modulated plane waves, really? ............................................ 187
18.5 A Fourier spectrometer based on the Talbot effect ...................................... 190
18.6 The walk-off effect ....................................................................................... 194
18.7 Yet another look at Talbot images ............................................................... 196

19 Fresnel Diffraction on Zone Plates and Lenses ................................................ 207
19.1 About inventing ............................................................................................ 207
19.2 Diffraction on the Fresnel Zone Plate ............................................................ 208
19.3 Image formation in terms of Fresnel diffraction .......................................... 210

20 What is a Light Ray? ..................................................................................... 213
20.1 Motivation of our approach .......................................................................... 213
20.2 The Fermat Principle as a consequence of wave optics ............................... 214
20.3 What are Shadows or “Non-Rays”? ............................................................ 218
20.4 Two examples of parageometrical optics ..................................................... 220
20.4.1 Tilted plane wave falling onto wide screen .......................................... 221
20.4.2 A spherical wave falling onto a wide slit ............................................. 224
20.4.3 An application of parageometric optics: ............................................. 227

21 Application of Fresnel Diffraction to Signal Detection ..................................... 229

22 Fraunhofer Diffraction .................................................................................. 231
22.1 Observer at distance $R$—no lens is involved ............................................... 231
22.2 Plane wave illumination—single lens ......................................................... 233
22.3 About the lens used for creating “infinity” ................................................... 235
22.4 The “light tube” ........................................................................................... 237
22.5 Convergent illumination ............................................................................. 238
22.6 Divergent illumination ............................................................................... 239
22.7 Fraunhofer diffraction by an array of equal objects .................................... 240
22.8 Babinet’s principle ..................................................................................... 243

### 30 Coherence

- **30.1 Fundamentals of coherence theory**
- **30.2 Coherence and interference by division of amplitude**
  - 30.2.1 Monochromatic point source
  - 30.2.2 Polychromatic point source
  - 30.2.3 Monochromatic extended source extended perpendicular to the mirror, observed at large \( z \)
  - 30.2.4 Monochromatic extended source extended parallel to mirror, observed at large \( z \)
- **30.3 Tolerances**
- **30.4 Solution of the example # 4, suggested for self-study:**
- **30.5 Coherence — Division of the Wavefront**
  - 30.5.1 Polychromatic point source
  - 30.5.2 Extended monochromatic source
- **30.6 Coherence — division by grating diffraction**
- **30.7 Coherence—Division by a scatter plate**
  - (Jim Burch ~1950)
- **30.8 Partial Coherence in Case of Wavefront Division**
- **30.9 A Final Look at Coherence Theory**
- **30.10 Group velocity**

### 31 Polarization

- **31.1 Polarization and Crystal Optics**
- **31.2 Some crystal-optical elements**
  - 31.2.1 Quater-wave plate
  - 31.2.2 Half-wave plate
  - 31.2.3 Refraction in the Wollaston prism
  - 31.2.4 Circular birefringence
- **31.3 Compensators**

### 32 Holography

- **32.1 Rogers’ Explanation**
- **32.2 Discussion of the phase loss**
- **32.3 Generalized Rogers’ Explanation**
- **32.4 Some attempts to remove the twin-image**
- **32.5 Wave Propagation and Fresnel Transformation**
- **32.6 Off-Line Fresnel Holography**
  - 32.6.1 Recording Step
  - 32.6.2 Reconstruction
  - 32.6.3 Theory of Off-Line-Fresnel Holography
  - 32.6.4 Theory of the reconstruction process
  - 32.6.5 About the Pseudoscopic Structure of the Conjugate Image
  - 32.6.6 Why is it so tricky to see the pseudoscopic image?
  - 32.6.7 Dynamic angular velocity
- **32.7 Classification of holographic setups**
  - 32.7.1 Fraunhofer off-line holography
32.7.2 Fourier holography (off-line) ........................................... 402
32.7.3 Lensless Fourier holography ........................................... 403
32.7.4 Image holography ....................................................... 407

33 Talbot bands ................................................................. 411

34 Influence of the photographic material on spatial data processing 421
34.1 Effects in a Photographic Emulsion .................................... 421
34.2 (3) Light Scattering During Recording ................................. 421
34.3 (4) The photographic nonlinear effect ................................. 424
34.4 (6) Adjacency Effect ...................................................... 426
34.5 (5) Grain-Noise ........................................................... 428
34.6 The influence of light scattering within the emulsion during holographic record-
ing ................................................................. 428
34.6.1 Image holography ....................................................... 428
34.6.2 Fourier holography ....................................................... 430
34.6.3 Fresnel hologram ........................................................ 432

35 The Space-Bandwidth-Product SW ....................................... 433

36 Appendix — publications reprinted from OSA Journals 459
Theta modulation in optics .................................................... 460
Character recognition by incoherent signal filtering ..................... 465
A lateral wavefront shearing interferometry with variable shear .... 472
Signal detection by correlation of Fresnel diffraction patterns ......... 476
Single-sideband holography .................................................. 481
Interferograms are image holograms ....................................... 486
Nonlinear effects in holography ............................................. 488
