Nonequilibrium Statistical Physics
Linear Irreversible Processes

Noëlle Pottier
Laboratoire Matière et Systèmes Complexes, CNRS, and
Université Paris Diderot – Paris 7
## Contents

### Chapter 1
**Random variables and random processes**
1. Random variables, moments, and characteristic function 2
2. Multivariate distributions 4
3. Addition of random variables 6
4. Gaussian distributions 7
5. The central limit theorem 9
6. Random processes 12
7. Stationarity and ergodicity 14
8. Random processes in physics: the example of Brownian motion 16
9. Harmonic analysis of stationary random processes 17
10. The Wiener–Khintchine theorem 19

### Appendix
1A. An alternative derivation of the Wiener–Khintchine theorem 23

### Bibliography
25

### References
25

### Chapter 2
**Linear thermodynamics of irreversible processes**
1. A few reminders of equilibrium thermodynamics 28
2. Description of irreversible processes: affinities and fluxes 29
3. The local equilibrium hypothesis 32
4. Affinities and fluxes in a continuous medium in local equilibrium 34
5. Linear response 37
6. A few simple examples of transport coefficients 38
7. Curie's principle 42
8. The reciprocity relations 43
9. Justification of the reciprocity relations 45
10. The minimum entropy production theorem 48

### Bibliography
50

### References
50
Supplement 6A
Landau damping
  1 Weakly coupled plasma 148
  2 The Vlasov equations for a collisionless plasma 148
  3 Conductivity and electrical permittivity of a collisionless plasma 151
  4 Longitudinal waves in a Maxwellian plasma 154
Bibliography 157

Chapter 7
From the Boltzmann equation to the hydrodynamic equations 159
  1 The hydrodynamic regime 160
  2 Local balance equations 161
  3 The Chapman–Enskog expansion 165
  4 The zeroth-order approximation 168
  5 The first-order approximation 169
Appendices
  7A A property of the collision integral 175
  7B Newton’s law and viscosity coefficient 176
Bibliography 180

Chapter 8
The Bloch–Boltzmann theory of electronic transport 181
  1 The Boltzmann equation for the electron gas 182
  2 The Boltzmann equation’s collision integral 184
  3 Detailed balance 187
  4 The linearized Boltzmann equation 188
  5 Electrical conductivity 189
  6 Semiclassical transport in the presence of a magnetic field 192
  7 Validity limits of the Bloch–Boltzmann theory 198
Bibliography 200
References 200

Supplement 8A
Collision processes 201
  1 Introduction 201
  2 Electron–impurity scattering 201
  3 Electron–phonon scattering 207
Bibliography 211
References 211

Supplement 8B
Thermoelectric coefficients 212
  1 Particle and heat fluxes 212
  2 General expression for the kinetic coefficients 213
  3 Thermal conductivity 213
  4 The Seebeck and Peltier coefficients 215
Bibliography 217
Chapter 11
Brownian motion: the Fokker-Planck equation
1 Evolution of the velocity distribution function
2 The Kramers–Moyal expansion
3 The Fokker–Planck equation
4 Brownian motion and Markov processes
Bibliography
References

Supplement 11A
Random walk
1 The drunken walker
2 Diffusion of a drunken walker on a lattice
3 The diffusion equation
Bibliography
References

Supplement 11B
Brownian motion: Gaussian processes
1 Harmonic analysis of stationary Gaussian processes
2 Gaussian Markov stationary processes
3 Application to Brownian motion
Bibliography
References

Chapter 12
Linear responses and equilibrium correlations
1 Linear response functions
2 Generalized susceptibilities
3 The Kramers–Kronig relations
4 Dissipation
5 Non-uniform phenomena
6 Equilibrium correlation functions
7 Properties of the equilibrium autocorrelation functions
Appendix
12A An alternative derivation of the Kramers–Kronig relations
Bibliography
References

Supplement 12A
Linear response of a damped oscillator
1 General interest of the study
2 The undamped oscillator
3 Oscillator damped by viscous friction
4 Generalized susceptibility
5 The displacement response function
Bibliography
Supplement 12B

Electronic polarization 329
  1 Semiclassical model 329
  2 Polarization response function 330
  3 Generalized susceptibility 331
  4 Comparison with the Lorentz model 331
Bibliography 334

Supplement 12C

Some examples of dynamical structure factors 335
  1 The examples 335
  2 Free atom 335
  3 Atom in a harmonic potential 337
Bibliography 340

Chapter 13

General linear response theory 341
  1 The object of linear response theory 342
  2 First-order evolution of the density operator 342
  3 The linear response function 345
  4 Relation with the canonical correlation function 347
  5 Generalized susceptibility 348
  6 Spectral function 350
  7 Relaxation 352
  8 Symmetries of the response and correlation functions 357
  9 Non-uniform phenomena 359

Appendices
  13A Classical linear response 361
  13B Static susceptibility of an isolated system and isothermal susceptibility 363
Bibliography 367
References 367

Supplement 13A

Dielectric relaxation 368
  1 Dielectric permittivity and polarizability 368
  2 Microscopic polarization mechanisms 371
  3 The Debye theory of dielectric relaxation 371
  4 A microscopic model of orientational polarization 374
Bibliography 378
References 378

Supplement 13B

Magnetic resonance 379
  1 Formulation of the problem 379
  2 Phenomenological theory 380
  3 A microscopic model 383
Bibliography 388
Chapter 14
The fluctuation-dissipation theorem 389
1 Dissipation 390
2 Equilibrium fluctuations 393
3 The fluctuation-dissipation theorem 395
4 Positivity of $\omega \chi''_{AA}(\omega)$ 398
5 Static susceptibility 398
6 Sum rules 400
Bibliography 403
References 403

Supplement 14A
Dissipative dynamics of a harmonic oscillator 404
1 Oscillator coupled with a thermal bath 404
2 Dynamics of the uncoupled oscillator 404
3 Response functions and susceptibilities of the coupled oscillator 407
4 Analysis of $\chi_{xx}(\omega)$ 409
5 Dynamics of the weakly coupled oscillator 415
Bibliography 417
References 417

Chapter 15
Quantum theory of electronic transport 419
1 The Kubo-Nakano formula 420
2 The Kubo-Greenwood formula 423
3 Conductivity of an electron gas in the presence of impurities 427
Bibliography 431
References 431

Supplement 15A
Conductivity of a weakly disordered metal 433
1 Introduction 433
2 The Kubo-Greenwood formula 433
3 Conductivity of a macroscopic system 436
4 Conductance of a mesoscopic system: Landauer’s approach 438
5 Addition of quantum resistances in series: localization 440
Bibliography 445
References 445

Chapter 16
Thermal transport coefficients 447
1 The indirect Kubo method 448
2 The source of entropy and the equivalent ‘Hamiltonian’ 452
Bibliography 457
References 457
## Supplement 16A

**Diffusive light waves**

1. Diffusive light transport 458
2. Diffusion coefficient of light intensity 459
3. Diffusive wave spectroscopy 462

Bibliography 467

References 467

## Supplement 16B

**Light scattering by a fluid**

1. Introduction 468
2. Linearized hydrodynamic equations 468
3. Transverse fluctuations 470
4. Longitudinal fluctuations 472
5. Dynamical structure factor 478

Bibliography 480

References 480
