

Forwarding on Gates

A flexible and scalable inter-network layer
supporting in-network functions

Florian Liers

Universitätsverlag Ilmenau
2014

Contents

1. Introduction	1
1.1. Research question	3
1.2. Scientific contributions	4
1.3. Research environment	5
1.4. Restrictions on the scope	5
1.5. Chapter overview	6
2. Background	9
2.1. Terms and definitions	9
2.1.1. Network, subnetwork, and inter-network	10
2.1.2. Layer and its architecture	11
2.1.3. Name and address	12
2.1.4. Connection, quality of service, and requirements	13
2.1.5. States	14
2.1.6. Routing, relaying, forwarding	15
2.2. Layer models	16
2.2.1. ISO/OSI	16
2.2.2. IP suite	21
2.2.3. Mixed versions	26
2.2.4. Recursive layers	26
2.3. Protocols	32
2.3.1. Relaying protocol control information	32
2.3.2. Error and flow control protocols	37
2.3.3. Access protocols	37
2.3.4. Resource information exchange protocols	39
2.4. Connections, states and quality of service	39
2.4.1. Connectionless networks and overprovisioning	41
2.4.2. Connectionless networks with quality of service add-ons	41
2.4.3. Connection-oriented networks	43
2.4.4. Inter-network issues	44
2.4.5. Political aspects and network neutrality	45
2.5. Dynamic protocol stacks	47
2.5.1. Service access points	48
2.5.2. Stack construction and selection	49
2.5.3. Stack runtime environment	49

3. Forwarding on Gates architecture	51
3.1. Motivation and design	53
3.1.1. Use case with Google and Deutsche Telekom	54
3.1.2. Possible solutions with today's Internet	56
3.1.3. Conclusions for new design	59
3.1.4. Related motivations	65
3.2. Communication model	66
3.2.1. Functional blocks	67
3.2.2. Chaining functional blocks	68
3.2.3. Example	72
3.2.4. Related work	73
3.3. Layer architecture	75
3.3.1. Interface	78
3.3.2. Transfer service	80
3.3.3. Routing service	82
3.3.4. Authentication service	85
3.3.5. Incremental routing process	88
3.3.6. Report and request functional blocks	92
3.3.7. Interaction with lower layers	93
3.3.8. Related work	95
3.4. Examples	98
3.4.1. Motivating use case	98
3.4.2. Emulation of IP	103
3.4.3. Emulation of MPLS	105
3.5. Political aspects	106
3.6. Deployment and interoperability	108
3.6.1. Deployment	109
3.6.2. Interoperability	110
3.7. Discussion	111
3.7.1. Review of evaluation questions	112
3.7.2. Comparison with reference model	114
4. Implementation of FoG	117
4.1. Use cases and design requirements	118
4.2. Software architecture	119
4.2.1. Plug-ins and extension points	119
4.2.2. Event simulation	121
4.3. Transfer service	122
4.3.1. Functional blocks	124
4.3.2. Packet structure and relaying	128
4.3.3. Access protocol	134
4.3.4. Error recovery	136
4.3.5. Mobility	140

4.4.	Routing services	141
4.4.1.	Simulated routing service	142
4.4.2.	BGP for FoG	145
4.4.3.	Mapping from requirements to gates	147
4.5.	Authentication services	151
4.6.	Emulator	152
5.	Performance studies	155
5.1.	Simulation setup	158
5.1.1.	Representing subnetworks	159
5.1.2.	Network load and applications	161
5.2.	Scalability of transfer service	161
5.2.1.	Packet overhead due to route length	162
5.2.2.	State distribution	165
5.2.3.	Discussion	168
5.3.	Scalability of routing service	169
5.3.1.	Creation of routing service policies and assumptions . . .	170
5.3.2.	Routing service requests	173
5.3.3.	Size of routing service graphs	174
5.3.4.	Runtime performance and trade-off	174
5.3.5.	Discussion	177
5.4.	Robustness of connections	179
6.	Conclusions	183
7.	Outlook	187
A.	Protocol control information formats	189
B.	FoG layer interface	199
B.1.	EventSource	199
B.2.	Layer	200
B.3.	Binding	203
B.4.	Connection	204
C.	Productions for mapping requirements to functions	207
D.	Performance studies for implementation	209
D.1.	Emulation setup	210
D.2.	Video streaming performance	211
D.3.	Application throughput	213
E.	Analysis of state distribution for FoG network	217
