Image Processing and Analysis
A Practical Approach

Edited by
RICHARD BALDOCK
MRC Human Genetics Unit,
Western General Hospital,
Crewe Road, Edinburgh EM4 2XU

and
JIM GRAHAM

List of Contributors xvii
Abbreviations xix

1. Microscope image acquisition 1
   Stephanie L. Ellenberger and Ian T. Young
   1. Introduction 1
      Microscope systems 1
      Case study 2
   2. Basic optics 3
      Nature of light 3
      Illumination 7
      Optical system 9
   3. Microscope image acquisition system 12
      Microscope types and components 12
      Camera types and performance 19
      Images 28
   4. Application 29
      Objective 29
      Materials and methods 30
      Performance 34
   References 35

2. Biological image processing and enhancement 37
   G. W. Horgan, C. A. Reid, and C. A. Glasbey
   1. Introduction 37
   2. Contrast manipulation 39
      Functional transformation 40
      Histogram-based transformations 41
      Pseudocolour 42
      Thresholding 43
      Zooming 46
   3. Filtering 46
      Linear filters 46
      Non-linear filters 50
3. Image analysis: quantitative interpretation of chromosome images

Kenneth R. Castleman

1. Introduction
   The karyotyping problem
   Historical perspective
   Current practice
   Automatic karyotyping

2. Image segmentation
   Thresholding
   The watershed algorithm
   Gradient image thresholding
   Laplacian edge detection
   Edge detection and linking
   Region growing

3. Boundary refinement
   Active contours
   Binary image processing
   Morphological image processing
   Boundary curvature analysis
   Touch and overlap resolution

4. Chromosome measurement
   Morphological features
   Banding pattern features

5. Chromosome classification
   The Bayes classifier

6. Karotype generation
   Chromosome straightening
4. Pattern recognition: classification of chromosomes

Jim Graham

1. Introduction

2. The chromosome classification problem

3. Classification methods
   - Defining classification in terms of probabilities
   - Using Bayes’ formula
   - Non-parametric methods

4. Features and feature selection
   - Selecting features
   - Combining features
   - Clustering

5. Neural networks
   - Introduction
   - Supervised training
   - Unsupervised training

6. Classifying chromosomes
   - Features
   - Data sets
   - Classifiers

7. Classifier validation
   - The need for validation
   - Cross-validation, the jackknife and the bootstrap
   - The confusion matrix
   - Validating issues for neural networks
   - Training-set size and validation
   - Validation issues for the two-class problem

8. Available material
   - Software
   - Further reading
Contents

Acknowledgements 150
References 150

5. Three-dimensional (3D) reconstruction from serial sections 153

Fons J. Verbeek

1. Introduction 153
   3D reconstruction in microscopy 153
   Why serial sectioning is necessary 154

2. Methodological aspects 156
   Modes of action 158
   Organizing the reconstruction data 159
   Methods and devices for the input of the data 161
   Spatial resolution 166
   Alignment and deformation correction 166

3. Mathematical aspects 173
   Estimation of transformations 173
   Spatial transformation of image values 174
   Image correspondences 175
   Point-pattern matching methods 175
   Shape-based assessment methods 178
   Registration and congruencing using image moment 180
   Affine transform component estimation 181
   Evaluation using similarity measures 184
   Intensity-based methods 185

4. Systems for routine application of 3D reconstruction 186
   Reconstruction under rigid transformation 187
   Reconstruction including deformation correction 187

References 194

6. 3D analysis: registration of biomedical images 197

Daniel Rueckert and David J. Hawkes

1. Introduction 197
   Intra-subject registration 198
   Inter-subject registration 198
   Serial registration 198
   Image to physical space registration 198
   Overview 199
Contents

2. Registration transformation 200
   Rigid transformation 200
   Affine transformation 200
   Projective transformation 201
   Elastic or fluid transformation 201

3. Registration basis 202
   Point-based registration 202
   Contour- and surface-based registration 204
   Voxel-based registration 207

4. Optimization 211

5. Applications 212
   2D registration 212
   3D-3D rigid registration 212
   3D-3D non-rigid registration 214
   Validation 215

6. Summary 217
   Acknowledgements 218
   References 219

7. Model-based methods in analysis of biomedical images 223

Tim Cootes

1. Introduction 223
2. Background 224
3. Application 225
4. Theoretical background 227
   Building models 227
   Image interpretation with models 232
   Active shape models 234
5. Discussion 240
6. Implementation 242

Appendices
Aligning the training set 242
Principal component analysis 244
Applying a PCA when there are fewer samples than dimensions 245
Aligning two shapes 246

Acknowledgements 246
References 246
Contents

8. Projective stereology in biological microscopy 249
   Andrew D. Carothers
   1. Introduction 249
   2. Points and distances 250
   3. Lines 253
   4. Surface areas 254
   5. Volumes 255
   6. Applications 256
      Determining the order of three DNA loci 256
      Location of chromosomal domains in cell nuclei 257
      Size of chromosomal domains in cell nuclei 259
   7. Discussion 259
   Acknowledgements 260
   References 260

9. Image warping and spatial data mapping 261
   Richard A. Baldock and Bill Hill
   1. Introduction 261
      Notation and numerical methods 262
   2. Image comparison 264
      Binary image overlay 264
      Colour comparator 267
      Blink comparator 268
   3. Image re-sampling 269
      Nearest neighbour interpolation 270
      Bilinear interpolation 270
      Computational efficiency 270
   4. Defining correspondence 273
   5. Global transforms 274
      Affine 275
      Polynomial 278
      Conformal 279
      Thin-plate spline 282
      Multiquadric 284
      Gaussian 284
   6. Local transforms 285
      Simple mesh transformation 285
      Elastic plate warping 286
