Monoclonal Antibodies

A Practical Approach

Edited by

Philip Shepherd
Guy's, King's and St Thomas' Schools of Medicine, Peter Gorner Department of Immunobiology, Guy's Hospital, New Guy's House, London Bridge, London SE1 9RT, U.K.

and

Christopher Dean
Section of Immunology, Institute of Cancer Research, McElwain Laboratories, 15 Cotswold Road, Belmont, Sutton, Surrey SM2 5NG, U.K.

List of protocols page xix
Abbreviations xxvii

1 Preparation of rodent monoclonal antibodies by in vitro somatic hybridization 1
   Christopher Dean and Philip Shepherd
   1 Introduction and strategy 1
   2 Choice of host for immunization and myeloma for cell fusion 3
   3 Choice of immunogen 4
   4 Preparation of antigen for immunization 5
      Soluble antigens 5
      Antigens expressed on live cells 5
      Plasmid DNA 6
      Peptides 7
   5 Route of immunization 7
      Generation of immune spleen cells 7
      Immunization via the Peyer’s patches of rats 7
   6 Growth of myeloma cell lines 9
   7 Preparation of cells for fusion 10
   8 Cell fusion 11
   9 Screening hybridoma culture supernatants for specific antibody 12
      Antigen coated multiwell plates 12
      Live or fixed cells 16
      Ligand binding assays 17
   10 Cloning of hybridomas 18
   11 Characterization and use of the antibodies obtained 19
      Isotyping of antibodies 20
      Epitope reactivity 20
      Specific immunoprecipitation 21
   References 23
2 Preparation of recombinant antibodies from immune rodent spleens and the design of their humanization by CDR grafting

Olivier J. P. Léger and José W. Saldanha

1 Introduction 25
2 Preparation of mouse spleen 26
3 Isolation of total RNA from spleen 28
4 Poly(A⁺) mRNA isolation 30
5 Reverse transcriptase reaction 31
6 Primary PCR of antibody genes 33
7 Preparation of linker 37
8 Assembly of VH and VK gene fragments with linker DNA 39
9 Assembly of single chain Fv antibody fragments 41
10 Reamplification of assembled scFv DNA 43
11 Restriction enzyme digestion of assembled scFv 44
12 Purification of pHEN-1 vector by equilibrium centrifugation in CsCl ethidium bromide gradients 46
13 Restriction digestion of the phage display vector, pHEN-1 49
14 Ligation of pHEN-1 and insert antibody scFv 50
15 Preparation of electroporation competent E. coli TG1 strain cells 52
16 Electroporation 53
17 Analysis of recombinant clones from the library 55
References 57

Appendix 58
1 The design of the humanized antibody 58
   Issues to consider 59
   References 64

3 Selection of antibodies from phage libraries of immunoglobulin genes

Jane K. Osbourn

1 Introduction 67
2 Preparation and storage of phage library stocks 68
   Phagemid libraries 68
   Phage libraries 69
3 Maintenance of bacterial stocks and titration of phage preparations 69
4 Selection of phage libraries on purified, immobilized antigen 71
   Immobilization of antigen on immunotubes 71
   Elution conditions 72
   Storage and rescue of the phagemid population after selection 72
   Choice of number of selection rounds 73
5 Selection of phage libraries on biotinylated antigen 74
   Biotinylation of antigen 74
   Selections using biotinylated antigen 75
6 Cell surface selections 76  
- Adherent cell selections 77  
- Cells in suspension 78  
- Screening the output of cell surface selections 78  
7 Proximity selections 78  
- Proximity selection using an existing antibody 80  
- Proximity selection using natural ligands 81  
- Step back selections 83  
8 Screening of selected phage 83  
- Basic screening assays 83  
- Affinity screening 87  
9 Soluble scFv production and purification 87  
References 89

4 ARM complexes for *in vitro* display and evolution of antibody combining sites 91  
Maria A. T. Groves, Margit Menges, Hong Liu, and Mingyue He  
1 Introduction 91  
2 Ribosome display methodology 93  
- Outline of procedure 93  
- Primer design and single chain antibody (VH/K) construction for ARM display 93  
- Generation of ARM complexes by coupled transcription/translation in vitro 96  
- Antigen selection of ARM complexes 98  
- Recovery and amplification of DNA from antigen-selected ARM complexes 100  
- Further ARM cycles and cloning 103  
- Analysis of clones encoding antibodies by ARM display 104  
3 Examples of ARM display 105  
- ARM specificity 105  
- Selection of DB3 VH/K from libraries 106  
4 Troubleshooting 107  
- Background 107  
- No DNA recovery 107  
5 Summary 107  
References 109

5 Human monoclonal antibodies to blood group antigens 111  
Belinda M. Kumpel  
1 Introduction 111  
2 General equipment and reagents required 112  
3 Selection of donor 113  
- Preparation of lymphocytes 113  
4 EBV transformation of B cells 114  
- Preparation of EBV 115  
- EBV transformation of B cells and growth of B-LCL 116  
5 Selection of antigen-specific B cells by rosetting 117
6 Fusion of B-LCL with murine myeloma cells (P3X63Ag8.653) 118
7 Screening techniques 120
8 Cloning 121
9 Cryopreservation of cells 122
References 123

6 Laboratory based methods for small scale production of monoclonal antibodies 125
Bryan Griffiths
1 Introduction 125
2 General principles 125
   Culture parameters 125
   Medium and serum 127
3 Stationary cultures 129
   Tissue culture plates and flasks 129
   Specialized (scale-up) culture systems 130
4 Stirred cultures 131
   Spinner flasks 131
   SuperSpinner 133
   Stirred bioreactors 134
5 Dynamic (non-stirred) culture systems 135
   Roller bottle culture 135
   Airlift fermenters 136
6 Perfusion (high cell density) systems 137
   Hollow fibre (Acusyst) culture 138
   Tecnomouse 138
   Membrane culture systems (miniPERM) 139
   Packed bed systems 140
   Fluidized bed bioreactors 142
7 Harvesting and concentration 143
   Harvesting and clarification 143
   Concentration 144
8 Summary 145
References 146

7 Isolation and purification of monoclonal antibodies from tissue culture supernatant 149
Geoff Hale
1 Objectives of antibody purification 149
2 Essential information about the antibody 150
3 Problems with purifying antibodies from culture supernatant 151
   Low concentration of antibody in culture supernatant compared with serum 151
   Potential contamination by bovine IgG 152
4 Equipment for antibody purification 153
   Equipment for chromatography 154
5 Precipitation methods 156
6 Affinity chromatography 158
   Reuse of affinity columns 159
   Choice of affinity ligand 160
   Immunofinity purification 162
7 Ion exchange chromatography 162
   Cation exchange chromatography 163
   Anion exchange chromatography 165
8 Immobilized metal affinity chromatography (IMAC) 166
9 Size exclusion chromatography (SEC) 168
10 Hydrophobic interaction chromatography 169
11 Other chromatographic methods 172
12 Choice of method 173
   Purification of antibody fragments 173
13 Storage of antibodies 173
14 Analysis of purity and activity 174
   Antibody concentration and purity 174
   Endotoxin contamination 177
15 Conclusion 179
   Acknowledgements 179
   References 180

8 Antibody production in plants 181
   Pascal Drake, Eva Stoger, Liz Nicholson, Paul Christou, and Julian K.-C. Ma
   1 Introduction 181
2 Expressing recombinant proteins in plants 181
   Plant hosts 182
   Antibodies in plants 182
   Modified viruses for transient expression in plants 185
   Glycosylation of recombinant proteins in transgenic plants 185
3 Plant transformation 186
   Gene constructs 187
   Agrobacterium tumefaciens-mediated transformation 188
   Principles of particle bombardment 192
4 Plant transformation techniques 196
   Agrobacterium-mediated transformation of tobacco 196
   Transformation of wheat by micro-projectile bombardment 199
5 Screening regenerated plantlets for immunoglobulin chain production 201
   Self- and cross-fertilization of transgenic plants 202
6 The overall advantages in expressing antibodies in plants 202
   References 203

9 Radiolabelling of monoclonal antibodies 207
   Stephen J. Mather
   1 Introduction 207
2 The choice of radionuclide 207
10 Non-radioactive antibody probes 237
G. Brian Wisdom

1 Introduction 237
2 Choice of label 238
3 General aspects of labelling 238
   The labelling reactions 238
   The monoclonal antibody 239
   Scale and ratios 239
   Purification and storage of the labelled antibody 239
4 Labelling with an enzyme 240
5 Labelling with fluorescein 242
6 Labelling with biotin 243
7 Labelling with digoxigenin (DIG) 244
8 Evaluation of labelled monoclonal antibodies 244
References 246

11 Immunogold probes for light and electron microscopy 247
Paul Monaghan and David Robertson

1 Introduction 247
2 Pre-embedding labelling for SEM and TEM 249
3 Thawed cryosections 251
4 Progressive lowering of temperature embedding (PLT) 255
5 Rapid freezing 256
6 Immunocytochemistry of resin sections 258
7 Multiple labelling 261
8 Conclusion 262
References 262

12 Characterization of cellular antigens using monoclonal antibodies 265
Gillian Hynes

1 Introduction 265
   Initial characterization of monoclonal antibodies 266
13 Immunoassays 297

Jane V. Peppard

1 Introduction 297

2 General considerations 297
   Selecting an antibody 297
   Selecting an assay standard 297
   Sample matrix 299
   Sample preparation and dilution 299
   Assay turnaround time 300

3 Solid support and separation options 301
   Microtitre plates 301
   Precipitation from solution 302
   Scintillation proximity 303

4 Labelling and detection of antibody or antigen 303
   Enzyme labelling 303
   Biotin labelling 305
   Labelling with lanthanide fluorophores 306
   Radioactive labelling 307
   Mass spectrometry 308

5 Setting up an assay 309
   Competitive binding immunoassay 309
   ‘Sandwich’ immunoassay 311
   Buffers 315
   Setting up an ELISA 316

References 318
3 Microscopy and imaging equipment
   Microscopes and associated hardware
   Imaging detectors for 3D sectioning microscopy
   Data analysis, image processing, and data presentation
4 Immunolabelling and visualization in living cells
   Labelling by microinjection of fluorescent antibodies
   Microscope set-up for live cell IFM
5 Examples of IFM in fixed cells
   References

17 FACS analysis of clinical haematological samples in transplantation
   for cancer
   Barbara C. Millar
   1 Introduction
   2 Fluorescence activated cell analysis
      General considerations
      Choice of antibodies, reagents, and general maintenance of the FACS analyser
      Dual fluorescence
      Preparation of clinical samples
      Quality control
      Calibration of the analyser
   3 Assessment of the progenitor cell content in bone marrow (BM) and peripheral blood
      stem cell (PCSC) harvests
      Rationale for measuring the progenitor cell content of BM and PBSC harvests for
      transplantation after intensive therapy for cancer
      The CD34 determinant
      Collecting peripheral blood stem cell (PBSC) harvests for CD34⁺ quantitation
      Collecting bone marrow (BM) harvests for CD34⁺ quantitation
      Quantitation of purified CD34⁺ cells from PBSC harvests from patients with chronic
      lymphocytic leukaemia
   4 Analysis of lymphocyte subsets in peripheral blood and bone marrow harvests from
      unrelated donors
      T cell depletion of paediatric matched (MUD) and unmatched (U-UD) bone marrow (BM)
      harvests from unrelated donors
      Analysis of lymphocyte subsets after transplantation or autologous rescue
      Measurement of intracellular cytokines in mononuclear cells (MNC) and T cells after
      transplantation or autologous rescue
   References

18 Immunocytochemical staining of cells and tissues for diagnostic
   applications
   Andrew R. Dodson and John P. Sloane
   1 Introduction
   2 Tissue and cell substrates
      Tissue sections
      Cytological specimens
3 Fixation and processing for paraffin wax embedded tissues 392
   Fixation 392
   Decalcification 392
   Processing 393
4 Section preparation 393
   Section adhesives 393
   Section storage 394
5 Primary antibodies 395
6 Immunocytochemical methodology 395
   Antigen retrieval 396
   Detection methodology 398
7 Reporter molecules 402
   Horseradish peroxidase 402
   Alkaline phosphatase 404
8 Enhancement 405
   Biotinylated tyramine 406
9 Controls 407
   Positive control 407
   Negative control 407
   External quality assurance scheme (EQA) 407
Acknowledgements 407
Suggested Further Reading 407

19 Detection of chemically modified DNA in lymphocytes of patients undergoing chemotherapy 411
   Michael J. Tilby
   1 Introduction 411
   Types of modifications to which antibodies can be produced 412
   Applications of antibodies against modified DNA 412
   Merits of raising antibodies against modified monodinucleotides versus modified polymeric DNA 412
   Requirements for detection of low frequencies of DNA modifications 414
2 Production of appropriate antibodies 414
   Immunization 414
   Screening hybridomas 415
3 ELISA techniques for quantification of DNA modifications 415
   Coating wells with DNA 416
   Direct binding assays 418
   Competitive assays 419
4 Staining for adducts in individual cells 426
   Staining techniques: conventional versus agarose embedded DNA 426
   Staining agarose embedded DNA 427
