Critical Evaluation of Mutagenicity Tests

Edited by
Rolf Baß, Vera Glocklin, Peter Grosdanoff, Dietrich Henschler, Brian Kilbey, Dieter Müller, Diether Neubert

Papers presented at the symposium, held in Berlin, February 22 – 25, 1982
## Table of Contents

**INTRODUCTION: ÜBERLA** .......................................................................................................................... 15

### I. THEORY

**RÖHRBORN**: Mutations in man ............................................................................................................. 21

**NEUBERT**: Mutagenicity as a basis for carcinogenicity ........................................................................ 37

**GEBHART**: In vivo detection of mutagenicity in man ............................................................................ 67

**OBE and NATARAJAN**: Some fundamental aspects on mutations in cell cultures ............................... 81

### II. METHODS and MECHANISMS

**NATARAJAN and CSUKAS**: Mechanisms of Sister Chromatid Exchanges ........................................... 99

**RÜDGER**: Bloom syndrome, a genetic model disease for induction and reduction of Sister Chromatid Exchange .......................................................................................................................... 111

**GEBAUER and RÖHRBORN**: Problems of SCE-Tests ........................................................................... 123

**MILTENBURGER**: Chromosome aberrations in somatic mammalian cells in vivo ................................. 131

**EHLING**: In vivo gene mutations in mammals ......................................................................................... 149

**MÜLLER**: Point mutations in mammalian cells in vitro and in the host-mediated assay ............................. 169

**WÜRGLER et al.**: Detection of point mutations; chromosome aberrations and somatic recombination in *Drosophila melanogaster* .................................................................................. 185

**ZIMMERMANN**: Mutagenicity testing with *Saccharomyces cerevisiae* .................................................. 225

**GÖGGELMANN**: Problems of microbial mutagenicity testing as exemplified by the Salmonella/microsome test ........................................................................................................................................ 243

**KRAMER**: In vitro tests - the problems with false negative and false positive results .............................. 259
III. SPECIAL TESTS

ROLL: Dominant lethal mutations (in vivo) during spermatogenesis in mammals ........................................... 273

BASLER: Chromosome aberrations in oocytes ........................................... 277

ADLER: The heritable translocation test ........................................... 291

WILD: The sperm morphology test, a rapid in vivo test for germinal mutations? ........................................... 299

LUTZ: In vivo covalent binding of mutagens to DNA ........................................... 307

KILBEY: DNA repair tests: their basis and performance ........................................... 317

KLOSE: Detection of induced point mutations in the mouse by the protein-mapping test ........................................... 333

PRETSCH and CHARLES: Biochemical detection of enzyme mutants in mammals in vivo ........................................... 343

MAIER: The Granuloma Pouch Assay (GPA) ........................................... 351

NASS and THOMALE: Alterations in the metabolism of transfer-RNA in mammals as indicator for cancer development ........................................... 363

ANDRAE: The DNA repair test with isolated hepatocytes ........................................... 371

POOL et al.: Employment of three bacterial assays for determining genotoxic properties of chemicals ........................................... 379

IV. METABOLISM

METZLER and HENSCHELTER: Significance of foreign compound metabolism for mutagenicity and carcinogenicity ........................................... 387

GLATT and OESCH: Metabolizing systems used in mutagenicity tests and their significance ........................................... 399

WIEBEL: Capacity of mammalian cell cultures for metabolising chemicals: prospect for the establishment of genotoxicity test systems ........................................... 421

GRAFE: Concentrations and doses in mutagenicity testing ........................................... 437

KRETSCHMER: Biometric designing and evaluation of mutagenicity testing ........................................... 453

VOLLMAR: A comment on F.-J. Kretschmer's paper ........................................... 457

de CARNERI and CASTELLINO: Distribution of spontaneous mutation values in Ames' test with and without metabolic activation ........................................... 465
V. MUTAGENICITY-CARCINOGENICITY

MARQUARDT: Malignant transformation of cells in culture 477

OESCH: Relationship between transformation and mutation in cells in culture 485

STYLES: The BHK cell transformation test: an appraisal of its performance and reproducibility 489

ASHBY: A logical approach to the detection of carcinogens and mutagens 497

GARNER: Comparison of results between whole animal studies and short-term tests for mutagenicity or carcinogenicity 509

VI. GUIDELINES

GLOCKLIN: Current FDA considerations about the role of mutagenicity studies in drug safety evaluation 527

FREDERICK: Critical evaluation of short-term tests for carcinogenicity - a Canadian viewpoint 533

TAYLOR and FLETCHER: A United Kingdom view of regulatory requirements for mutagenicity testing 545

LOPRIENO and POGGIOLINI: Legislative actions for the mutagenicity testing of new drugs in Italy 553

BRUNAUD: Justification for mutagenicity testing; Point of View of a French Toxicologist 561

KRAMERS et al.: The Dutch guidelines for mutagenicity testing, and a note on their application to pharmaceutical drugs 565

MOLANDER: Mutagenicity testing - Viewpoint of the Swedish regulatory agency 573

FISCHER: Mutagenicity testing as viewed by the IKS (Switzerland) 577

LINGK: International harmonizing of test guidelines 581

KORTE et al.: The regulatory approach to mutagenicity testing of chemical substances in the Federal Republic of Germany. Extent of testing and interpretation 587

ROLL et al.: The regulatory approach to mutagenicity testing of chemical substances in the Federal Republic of Germany. Practical Application of the legislation with regard to chemical substances 595

VII. CRITICAL ASSESSMENT

HESS and BERNHARD: The value of mutagenicity test results in risk assessment ................................................................. 609

MÜLLER: The usefulness of mutagenicity tests in assessing the mutagenic and cancerogenic potential of chemical substances .............................................................................................................. 627

BAß et al.: Critical evaluation of mutagenicity testing ..................... 641

FINAL REMARKS: KORTE et al., .................................................... 647

APPENDIX: Notes for Guidance: Proposed EEC ............................. 649

INDEX: ...................................................................................... 655

LIST OF CONTRIBUTORS: ......................................................... 657
