

From
Quarks to Pions
Chiral Symmetry and Confinement

Contents

<i>Preface</i>	v
1 QCD	1
1.1 Why quarks	2
1.2 Gluons and confinement	3
2 Perturbation theory is not enough	7
2.1 Zero dimensions	8
2.2 Scalar field theories and Landau poles	8
2.3 Solvable theories	9
2.4 QCD	10
2.5 The lattice as a non-perturbative cutoff	11
3 Lessons from two dimensions	13
3.1 The scalar field	14
3.2 The fermion field	16
3.3 Chiral fields	17
3.4 Exponentiated fields	19
3.5 The mapping	20
4 The two-dimensional Ising model	23
4.1 The transfer matrix	24
4.2 Domain boundaries as fermions	25
4.3 Diagonalization in momentum space	27

5	Path integrals and statistical mechanics	31
5.1	Discretizing time	31
5.2	The transfer matrix	33
5.3	Typical paths are non-differentiable	35
6	Quark fields and Grassmann integration	37
6.1	Fermionic transfer matrices	39
6.2	Normal ordering and path integrals	41
7	Lattice gauge theory	45
7.1	Link variables	46
7.2	Group integration	48
7.3	Gauge invariance	50
7.4	Numerical simulation	52
7.5	Order parameters	53
8	Monte Carlo simulation	55
8.1	Bosonic fields	55
8.2	Fermions	59
8.3	The conjugate-gradient algorithm	60
8.4	Hybrid Monte Carlo	62
9	Renormalization and the continuum limit	67
9.1	Coupling constant renormalization	67
9.2	A parameter-free theory	70
9.3	Including quark masses	71
9.4	Which beta function?	74
9.5	Flows and irrelevant operators	77
10	Classical gauge fields and topology	81
10.1	Surface terms	83
10.2	An explicit solution	85
11	Zero modes and the Dirac operator	89
11.1	The index theorem	90
11.2	Topology and eigenvalue flow	93

12	Chiral symmetry	97
	12.1 Effective potentials	99
	12.2 Goldstone Bosons	101
	12.3 Pions and spontaneous symmetry breaking	102
	12.4 The Sigma model	106
13	The chiral anomaly	113
	13.1 What broke the symmetry?	114
	13.2 A discrete chiral symmetry	115
	13.3 The 't Hooft vertex	118
	13.4 Fermions in higher representations	122
14	Massive quarks and the Theta parameter	125
	14.1 Twisted tilting	125
	14.2 Odd N_f	126
15	Quark masses in two-flavor QCD	131
	15.1 The general mass term	135
	15.2 The strong CP problem and the up quark mass	138
	15.3 The two-flavor phase diagram	139
16	Lattice fermions	145
	16.1 Hopping and doublers	146
	16.2 Spinors and chiral symmetry	147
	16.3 Wilson fermions	148
	16.4 Lattice versus continuum parameters	152
	16.5 Artifacts and the Aoki phase	153
	16.6 Twisted mass	157
17	Actions preserving chiral symmetry	161
	17.1 The Nielsen-Ninomiya theorem	161
	17.2 Minimal doubling	163
	17.3 Domain wall and overlap fermions	166
	17.4 Staggered fermions	171

18	Quantum fluctuations and topology	177
18.1	Cooling	178
18.2	Uniqueness	180
19	The Standard Model	183
19.1	Where is the parity violation?	185
19.2	A lattice model	186
20	Final remarks	191
	<i>Bibliography</i>	193
	<i>Index</i>	203
