PART 1: KNOWLEDGE-BASED FAULT DIAGNOSIS, SIMULATION, SUPERVISION AND CONTROL

1. A look at the knowledge-based approach to system fault diagnosis and supervisory control
   S.G. Tzafestas ........................................... 3

2. Reasoning from structure and behavior: Towards a methodology
   J.-M. David and J.-P. Krivine ......................... 17

3. What happened? Causal reasoning in DIVA
   J.-M. David and J.-P. Krivine .......................... 23

4. FRaHM: Framework for reasoning about hierarchical/multi-vues models
   R. Lbath, N. Giambiasi and C. Delorme .............. 29

5. A theorem prover as a fault diagnostic tool
   T. Panagiotopoulos, G. Papakonstantinou and
   G. Stamatopoulos ....................................... 43

6. Attribute grammars as a knowledge-based diagnostic tool
   C. Moraitis, G. Papakonstantinou and S. Tzafestas 53

7. EIDEMON: An expert system for industrial equipment maintenance
   R. E. King, L. Beke and E. T. Cosmidis ................ 63

8. An expert system design using cause-effect representations and simulation for fault
detection
   A. H. Jones and S. E. Burge ........................... 71

9. RELSHELL: An expert system shell for fault diagnosis
   I. Gazdik ................................................. 81

10. An expert system design for fault diagnosis in electrochemical operations:
    A qualitative approach
    F. A. Batzias .......................................... 105

11. Error recovery using attribute grammars
    M. Sideri, S. Efremidis,
    G. Papakonstantinou and E. Skordalakis ............. 123
12. Error detection and correction in linguistic representation of ECG waveforms
   P. Trahanias, G. Stamatopoulos and E. Skordalakis 133

13. THESEE: A knowledge-based system for test pattern generation
   C. Ouassalah, J.F. Santucci, C. Vanwassenhove and P. Roux 145

14. Knowledge-based process monitoring and failure detection applied to gas transmission networks
   G. Lappus 167

15. Design and test of an expert process controller based on human operator's knowledge and mental skills
   G. K. Schmidt and B. Bieker 183

16. Parallel simulation techniques as kernel of a decision support system for control of large gas transmission networks
   G. K. Schmidt, R. Maier and G. Lappus 199

17. The batch selection by a Prolog rule base of objects on a conveyor for paint spraying.
   C. D. Farris and R. J. Lucas 215

18. Structural symbolic simulator of digital systems
   N. Giambiasi, G. Piana and S. Saumont 225

19. Design of an interlaboratory network for fault detection in industrial production processes
   F. A. Batzias 239

20. RUBRIC: A rule based approach to the development of reliable information systems
   P. Loucopoulos and P. J. Layzell 253

21. A method of data protection for large scale business computer systems
   A. P. Andritsakis 265

22. A new approach to perturbation analysis for manufacturing scheduling problems
   Q. Jiang 273
PART 2: FAULT-TOLERANT, SELF-CHECKING AND OTHER DIGITAL TECHNIQUES

1. On an adaptable pipeline architecture with fault tolerance capabilities
T. Panagiotopoulos, P. Tsanakas and N. Alexandridis ........................................... 291

2. A fault tolerant dynamic RAM memory system
D. Nikolos, P. Kostarakis and A. M. Paschalis ......................................................... 301

3. Towards fault tolerant real-time process control system
A. M. Deplanche and J. P. Elloy .......................................................... 309

4. On the configuration of fault tolerant distributed process control systems
G. D. Hassapis .......................................................... 327

5. Efficient design of totally self-checking checkers for all separate low-cost arithmetic codes
D. Nikolos, A. M. Paschalis and G. Philokyprou ......................................................... 345

6. Towards concurrently totally self-checking microprogram control units
A. M. Paschalis, C. Halatsis and G. Philokyprou ......................................................... 357

7. Further results of the performance of a double loop computer network under fault conditions
S. Angelopoulos, G. Papadopoulos and S. Koubias ....................................................... 369

8. Recovery assessment after microprocessor system transient disturbances
R. G. Halse and C. Preece .......................................................... 383

9. A functional simulation of a pipelined multiprocessor coding system using PETRI-nets
N. G. Bourbakis .......................................................... 399

10. Experimental device for IC testing
N. A. Glaros and E. A. Kayafas .......................................................... 417

11. Fault diagnostics and SFT analysis in intelligent flowmeters
D. E. Ventzas .......................................................... 423

Index .......................................................... 435
