Rolf Klein, Raimund Seidel, Seth Teller (editors):

Computational Geometry

Dagstuhl-Seminar-Report; 168
10.02.-14.02.97 (9707)
Contents

1 Computing Roadmaps of Semi-algebraic Sets on a Variety 4
2 The Shape of a Set of Points 4
3 Realistic Input Models for Geometric Algorithms 5
4 Data Structures for Mobile Data 5
5 Recent Progress on Computing the Minimum Weight Triangulation 6
6 Non-Canonical Randomized Incremental Construction and General Position 7
7 Isomorphic Triangulations and Map Conflation 7
8 Nearest Neighbor Searching in Metric Spaces 8
9 Extending GeomBib 9
10 A Perturbation Scheme for Spherical Arrangements with Application to Molecular Modeling 9
11 Progressive Simplicial Complexes 10
12 Some Practical Models and Challenges for Computational Geometry 11
13 Checking Geometric Programs or Verification of Geometric Structures 12
14 CGAL - A C++ Template Library 12
15 A Strong and Easily Computable Separation Bound for Arithmetic Expressions Involving Radicals and Geometric Applications 14
16 A Simple Polynomial-Type Approximation Scheme for Geometric Network Optimization 14
17 A Probabilistic Analysis of the Power of Arithmetic Filters

18 The Existence of a Short Sequence of Admissible Pivots to an Optimal Basis in LP and LCP

19 Direction-Sensitive Voronoi-Diagrams

20 On Some Geometric Optimization Problems in Layered Manufacturing

21 Representing distances by coordinates

22 Approximating Weighted Shortest Paths on Polyhedral Surfaces

23 Finding Some Path When You Know At Least One Exists

24 Raising Roofs, Crashing Cycles, and Playing Pool: Applications of a Data Structure for Finding Pairwise Interactions

25 How to Move a Mountain

26 Binary Space Partitions: Old and New Results

27 Point Set Matching

28 A Practical Approximation Algorithm for the LMS Line Estimator

29 On the Complexity of the Union of Fat Convex Objects in the Plane

30 Open Problems
