## CONTENTS

Preface v  

Research and development for medium and extended-range forecasts 1  
   A. Hollingsworth  

Performance estimation of the earth simulator 34  
   M. Yokokawa, S. Shingu, S. Kawai, K. Tani, H. Miyoshi  

An operational parallel weather prediction system 54  
   D. Dent  

Parallel aspects of ECMWF's integrated forecasting system (IFS) with special emphasis on data assimilation 61  
   M. Hamrud  

Toward a teraflop computing infrastructure at FNMOC 67  
   D. W. Jones, P. F. Moersdorf, R. M. Clancy  

Investigation of the scalability of pre-processing, post-processing and computational modules of the NOGAPS spectral forecast model 77  
   T. E. Rosmond  

Parallel fast Legendre transform 87  
   M. Alves de Inda, R. H. Bisseling, D. K. Maslen  

Parallelization of the NCEP global spectral model 109  
   Y. Trémolet, J. Sela  

Design of a next-generation regional weather research and forecast model 117  
   J. Michalakes, J. Dudhia, D. Gill, J. Klemp, W. Skamarock  

Development of parallel climate/forecast models on 100 GFLOPS PARAM computing system 125  
Future requirement of computer power and parallelization of NWP at JMA

C. Muroi

Fujitsu's high performance computing

K. Uchida

Load balancing physics routines

R. W. Ford, P. M. Burton

4-D-Var experiments on a distributed memory parallel computer

Y. Trémolet, J. Sela

Environments for sustaining and sustainable teracomputing

— An overview of the QSW supercluster architecture

J. Taylor

Performance of the parallelized regional climate model REMO

T. Diehl, V. Gülsow

Operational parallel processing at Météo-France

J.-F. Estrade, D. Paradis, E. Sevault

Running the unified model on the CRAY T3E

P. Burton, A. Dickinson

Performance requirements for DWD's new models

U. Schättler, E. Krenzien

Operational numerical weather prediction models on the CRAY T3E

D. Salmond, A. Dickinson, N. Gustafsson, B. Carruthers

A parallel 3-dimensional variational data assimilation (3D-Var) for HIRLAM

M. Lindskog, N. Gustafsson

Year 2000 weather forecast needs teracomputing

H. Mierendorff, K. Cassirer, R. Hess, W. Joppich

Limits of instruction level parallelism in IFS

D. F. Snelling

Tool support for analysis and transformation of large-scale Fortran applications

B. Chapman, F. Wollenweber, M. Egg

Teraflops — A new dimension for high performance computing in meteorology

G.-R. Hoffmann

DAMP — The data management in climate research project

K. Kleese

Enhancing OpenMP with features for locality control

B. Chapman, P. Mehrotra, H. Zima

Application of Plug and Play FORTRAN at the Danish Meteorological Institute

J. U. Jørgensen

Parallelizing the Princeton ocean model using TOPAZ

W. D. Oberpriller, A. Sawdey, M. T. O'Keefe, S. Gao

Optimisation for vector and RISC processors

M. Ashworth

A distributed database for observation handling

S. Saarinen

The regional weather forecasting system SKIRON: Parallel implementation of the ETA model

L. A. Boukas, N. Th. Mimikou, N. M. Missirlis, G. Kallos

Parallelization of the FSU global and regional spectral models on shared and distributed memory architectures

S. Cocke, Z. Christidis

Towards the RAMS-FINEP parallel model: Load balancing aspects

S. R. M. Barros

A strategy for terascale climate modeling

Experience of using parallel computers in meteorology: Summary of the discussion

P. Prior

List of participants

B. Chapman, F. Wollenweber, M. Egg
