Volume III

Plenary Talk
Representing speech ................................................................. 1241

Parameter Estimation
Sequential estimation of probability of events .................................. 1249
Closed-loop identification via time and frequency domain approaches ........ 1253
An efficient method for chaotic signal parameter estimation .................. 1257
Nonparametric statistics for subspace based frequency estimation ............. 1261
A cumulant based algorithm for the identification of input output quadratic systems ................................................................. 1265
On the application of minimum phase space volume parameter estimation .... 1269
Frequency estimation of radar/sonar signals against correlated non-Gaussian noise ... 1273
Small sample statistics of the Yule-Walker method for autoregressive parameter estimation ................................................................. 1277

Speech Recognition
Low bit rate speech compression for playback in speech recognition systems .... 1281
Nonlinear signal decomposition into functional series for speech recognition: a new approach ................................................................. 1285
Speaker independent speech recognition with robust out-of-vocabulary rejection ..... 1289
Robust connected digit recognition in a car noise environment .................. 1293
Speech recognition complexity reduction using decimation of cepstral time trajectories ................................................................. 1297
A phonetic vocoder for Finnish ....................................................... 1301
Serbian spoken dialogue system for bus travel information retrieval .......... 1305
Fusing length and voicing information, and hmm decision using a Bayesian causal tree against insufficient training data ................................................................. 1309
Speech Coding
Standardisation of the adaptive multi-rate codec ........................................ 1313
Adaptive window excitation coding in low-bit-rate CELP coders ...................... 1317
Combining parametric and waveform-matching coders for low bit-rate speech coding ........................................................................................................... 1321
A 2.4/1.2kb/s speech coder with noise pre-processor ...................................... 1325
A harmonic+noise coder with improved transient speech performance .......... 1329
A subjective performance study of a sinusoidal speech coding model .......... 1333
Fractal prediction in waveform coding of speech signals .............................. 1337

Color Image Processing
Color image restoration using compound gauss-Markov random fields .......... 1341
Multichannel image processing using fuzzy vector median-rational hybrid filters ..... 1345
New multispectral edge detection methods based on roughness and differential prewitt ........................................................................................................ 1349
Using colour features to block dubious images ............................................ 1353
Enhancement and registration of multichannel images based on vector order filter .... 1357
Color transformations for lossless image compression .................................... 1361
Fast k-NN classification with an optimal k-distance transformation algorithm ...... 1365
The colour in the upcoming mpeg-7 standard .............................................. 1369

Multimedia Indexing, Browsing and Retrieval
Video classification based on hmm using text and faces .............................. 1373
Indexing spatial content of still texture in MPEG-4 ....................................... 1377
An effective image representation for visual information retrieval ............... 1381
Content-based image retrieval using fuzzy visual representation .................. 1385
A framework for ordinal-based image correspondence ............................... 1389
Color fragmentation-weighted histogram for sketch based image queries .................. 1393

Color-based retrieval of facial images .......................................................... 1397

**Array Signal Processing**

Minimax robust m-beamforming for moving sources and impulse noise environment ................................................................. 1401

Structured spatial interference rejection combining ..................................... 1405
Robust speaker localization using a microphone array .................................. 1409

Robust phase shift estimation in noise for microphone arrays with virtual sensors .... 1413

Array calibration in the presence of unknown sensor characteristics and mutual coupling ................................................................. 1417

Detection-estimation of more uncorrelated Gaussian sources than sensors using partially augmentable sparse antenna arrays .......................................................... 1421

Downlink space-time processing for FDD systems .......................................... 1425

Multi-source localization in reverberant environments ..................................... 1429

Robust and constrained downlink beamforming ............................................. 1433

A deconvolution method for the characterization of distributed sources via linear prediction ................................................................. 1437

Using phase conjugation for underwater acoustic communication: design guidelines ............................................................................ 1441

Optimum self-reference spatial diversity processing for FDSS and FH communication systems ................................................................. 1445

**Motion Estimation and Video Compression**

Adaptive multiresolution imager based on FPGAs ........................................ 1449

Rotational motion estimation and analysis in digital image sequences .............. 1453

Real-time implementation of h.263 video encoder on tms320c6201 fixed point dsp... 1457

An active mesh based tracker for feature correspondences ................................ 1461

Robust motion estimation using spatial Gabor filters .................................... 1465
Joint source and channel rate allocation for video transmission over erasure channels

Motion field estimation by combined vector rational and bilinear interpolation for MPEG-2 error concealment

Velocity estimation and moving object's detection by using wavelet transform and parallel Kalman filter

Improved color coding for scalable 3D wavelet video compression

A data fusion method for improved motion estimation

Multi-resolution mesh-based motion estimation using a "backward in forward" tracking method

**DSP for Communications**

An adaptive method for closed-loop TAD in FDD mode

Digital filter design for I/Q imbalance compensation

Adaptive trained neural networks for traffic prediction of VBR MPEG-2 video sources

Adaptive channel equalization using classification trees

Multiuser detection in multipath non-Gaussian channels

High performance estimation algorithm for PSK frequency recovery

Digital down conversion in software radio terminals

On-line evaluation of equalizer performance based on high-order statistics

Majority selection and block-based selection diversity reception methods for 8k DVD-T in a mobile environment

A recursive algorithm for maximum likelihood trend estimation in exponential noise and its application to IP telephony

Statistical analysis of multidimensional filters driven non-Gaussian non-white noises

Complex digital oscillator with absolute periodicity
Wast3g: a comprehensive WCDMA simulation tool for third-generation mobile communications ................................................................. 1541

Teager-Kaiser operator based filtering................................................................. 1545

**Blind Methods in Communications**

Low cost adaptive algorithm for blind channel identification and symbol estimation .................................................................................. 1549

A fast algorithm for conditional maximum likelihood blind identification of SIMO/MIMO fir systems ......................................................... 1553

On AR equalization with the constant modulus criterion .................................... 1557

Globally convergent algorithms for blind source separation ................................ 1561

A „unimodal” blind equalization criterion .......................................................... 1565

Identifiability conditions for deterministic blind beamforming in the presence of incoherent multipath with small delay spread................................. 1569

Blind equalization of sparse channels using antennas diversity .......................... 1573

On blind fractionally-spaced equalization using analytical constant modulus ........ 1577

Asymptotic analysis of blind cyclic correlation based symbol rate estimation ........ 1581

**Statistical Signal Processing and DOA**

Wide-band signal parameter estimation based on higher-order statistics .......... 1585

A design method for small sensor arrays in angle of arrival estimation .............. 1589

Resolution enhancement of spatial spectrum by a virtually expanded array .......... 1593

Detection of the source number by the gerschgorin disks ................................. 1597

A novel approach to array steering vector estimate improvement ..................... 1601

Computationally efficient DOA estimation of a scattered source ....................... 1605

A new approach for tracking mobiles with local scattering modeling .................. 1609

Using linear and nonlinear decompositions in state- space for calculating minimal dimension embedding of chaotic attractor ......................................... 1613

Generalized almost-cyclostationary signals on multipath doppler channels ....... 1617
Channel Estimation
Joint carrier phase and frequency offset tracking in OFDM systems .................. 1621
Co-channel interference rejection using clustering techniques and fuzzy inference .... 1625
Interference-resistant lptv-MMSE equalization .................................................. 1629
Optimal training sequences for TDMA systems ................................................. 1633
Two-dimensional pilot-symbol-aided frequency offset tracking in orthogonal multicarrier wireless systems ................................................................. 1637
Monte Carlo sampling methods for adaptive channel estimation and detection over a Rayleigh fading channel ................................................................. 1641
Neural sequence detector for digital equalization ................................................ 1645
Performance study of DD ML phase estimators for ds-cdma communications systems 1649
Effect of interleaving on a Gilbert channel ....................................................... 1653

Multimedia Watermarking
Digital watermarking of visual data: state of the art and new trends .................. 1657
Optimal detection of multiplicative watermarks ................................................ 1665
A framework for optimal adaptive DCT watermarks ......................................... 1669
A robust digital watermark procedure for still images using DCT phase modulation.. 1673
Watermarking using complex wavelets with resistance to geometric distortion ...... 1677
A region-based technique for chaotic image watermarking ............................... 1681
Public key watermarking by eigenvectors of linear transforms ........................... 1685
Achieving imperceptibility in all-pass watermarking of speech signals ................ 1689

Efficient Algorithms for Hardware Implementation
Design of digital filters with low power consumption ........................................ 1693
On high-speed recursive digital filters ............................................................. 1701
VHDL-based implementations of area and power efficient filter architectures ....... 1705
Joint module selection and retiming with carry-save representation .......................... 1709

On structure and implementation of algorithms for carrier and symbol synchronization in software defined radios .......................................................... 1713

Algorithmic noise-tolerance for low-power signal processing in the deep submicron era .......................................................... 1717

H.263 video encoder implementation on a scalable DSP system .......................... 1721

Fast implementation of the LMS algorithm .......................................................... 1725

Wavelets and Filterbanks
Real-time linear time-frequency transform .......................................................... 1729

A realization of wavelet filter bank with adaptive filter parameters .................. 1733

A wavelet-based technique for image refinement ................................................ 1737

Design of causal stable IIR filter banks with powers-of-two coefficients ........ 1739

Multiplier-less low-delay fir and IIR wavelet filter banks with sopot coefficients ..... 1743

Coefficient quantization in perfect-reconstruction cosine-modulated filter banks ..... 1747

Planar shape representation based on multiwavelets ............................................ 1751

Filter design for adaptive lifting schemes ......................................................... 1755

2-d diamond/quadrant fir digital filter banks with sharp responses .................. 1759

Integer-modulated filter banks providing perfect reconstruction ..................... 1763

Degenerate eigenvalues - a method to design adaptive discrete time wavelets ........ 1767

Comparison of OFDM and wpm for fourth generation broadband WLAN .......... 1771

On block-recursive logarithmic filterbanks ...................................................... 1775

A line spectrum approach for the design of optimum compaction fir filters ......... 1779

Parameter Estimation
Robust estimation of an AR multi-channel model by $t$-distribution assumption ..... 1783

Measuring radar statistics by using Kalman filter ............................................. 1787
An augmented iterative method for large linear Toeplitz systems .................................................. 1791

Asymptotic normality of sinusoidal frequencies estimated by second-order algorithms for mixed spectra time series ................................................................. 1795

Supervised frequency change detection using MCMC methods ....................................................... 1799

Estimation and smoothing of instantaneous frequency of noisy narrow band signals .................. 1803

Frequency estimation by 1-bit quantization and table look-up processing ................................. 1807

Ambiguities in statistical signal processing .................................................................................... 1811

Statistical analysis of a parametric model for photometric signals ........................................... 1815

MAP and LS estimation of abrupt changes in multiplicative of additive noise using dynamic programming ......................................................................................... 1819

Order selection of 2-d AR model using a lattice representation and information criteria for texture analysis ......................................................................................... 1823

Choosing priors for an important class of signal processing problems ....................................... 1827

Time-delay estimation of the line-of-sight signal in a multipath environment ............................ 1831

**Acoustic, Echo and Noise Control**

Comparison of different adaptive algorithms for stereophonic acoustic echo cancellation .................. 1835

Frequency domain active noise control system without secondary path model ......................... 1839

Gsaec - acoustic echo cancellation embedded into the generalized sidelobe canceller ................................. 1843

Step-size control for acoustic echo cancellers applying an RBF network ................................ 1847

Improved noise reduction for hands-free car phones utilizing information on vehicle and engine speeds ........................................................................................................ 1851

Frequency selective step-size control for acoustic echo cancellation .................................. 1855

A Kalman filter approach to active noise control ....................................................................... 1859

Flexible cochlear system based on digital model of cochlea: structure, algorithms and testing ............................................................................................................. 1863
RLS-adapted polynomial for nonlinear acoustic echo cancelling................. 1867

Sparse-beap: a fast implementation of fast affine projection avoiding explicit regularisation............................................................................................................... 1871

A nonlinear acoustic echo canceller for hands-free telephony ..................... 1875
