2ND INTERNATIONAL MEETING ON IRROMAKING

1ST INTERNATIONAL SYMPOSIUM ON IRON ORE

Parallel event:
5TH JAPAN-BRAZIL SYMPOSIUM ON DUST PROCESSING-ENERGY-ENVIRONMENT IN METALLURGICAL INDUSTRIES

VITÓRIA, ESPÍRITO SANTO
BRAZIL
SEPTEMBER 12-15, 2004
Simultaneous Decarburization and Nitrogen Removal by Blasting Iron Ore Powder on to Molten Steel Surface ........................................................................................................ 675

Study of the Portland Cement Pastes Behavior with Different Amounts of Electric Arc Furnace Dust (EAFD) ........................................................................................................ 685

Study of the Process of Reduction and Sintering of Self-Reducing Pellets Between 1573 and 1673K ........................................................................................................ 695

Surface Rearrangement during wüstite reduction within its existence, The .................. 705

Tridimensional Multiphase Mathematical Model of Dioxin Generation Within the Sintering Bed ........................................................................................................ 715

Zinc Oxide Addition in Cement Pastes to Study the Viability of Recycling Electric Arc Furnace (EAF) Dust in Civil Construction ..................................................... 725

V.2

CHAPTER 3 .................................................................................................................. 749

PAPERS FROM INVITED LECTURERS - 2ND INTERNATIONAL MEETING ON IRONMAKING AND 1ST INTERNATIONAL SYMPOSIUM ON IRON ORE

Blast Furnace Modeling and Its Application to Propose New Operations .................. 751

Coal Fluidity, Stockpiling and Coke Quality ................................................................ 761

Coke Industry Biological Wastewater Treatment in the Twenty-First Century .......... 771

Cold Agglomerating Technology Interblocks ............................................................. 781

Compacted Charging: A Process for Economical Coke Making .............................. 1231

Cosipa Coal Blends Evolution in the Previous Years Aiming at the Suitability of Blast Furnaces Necessities ................................................................. 791

Critical Factors in the Development of Blast Furnace Burden Materials - LKAB’s Vision ........................................................................................................ 803

Design and First Operational Experience of the Pressure Regulated Oven System (PROven) at the Coke Plant “Schwelgern” ......................................................... 817

Evaluation of a New Process for Ironmaking: a Productivity Model for the Rotary Hearth Furnace ................................................................. 833

Evaluation of Iron Ores for their Pelletizing and Sintering ...................................... 859

Factors Affecting Coke Size and Fissuring During Cokemaking ................................. 871
Ferrous Burden Quality Requirements for High Productivity and Low Coke Rate Blast Furnace Operation ................................................................. 881
Fundamental Studies on Blast Furnace Burden Softening and Melting ........................................... 893
Improving Productivity and Reducing Costs at the Blast Furnace - The Experience of TKS ................................................................. 903
Influence of the Coke Quality on the Productivity of the Blast Furnace ......................................... 919
Latest Developments by VAI In the Field of Iron-Ore-Sintering Technology .................................. 929
Low Grade Iron Ore Operation of Voestalpine Stahl Donawitz ..................................................... 937
Management of Steel Industry By-Products ...................................................................................... 947
Metallurgical Properties and Mineralogy of Iron Ore Pellets ......................................................... 957
Mining and the Environment .......................................................................................................... 969
Mining Telerobotics for Underground and Open Pit: An Implementation Progress Report ................................................................. 971
Model Based Optimizing Control System Implemented for the Control of the Pelletizing Furnaces at Cia. Vale do Rio Doce - Vitória - ES- Brazil ......................................................... 983
Modelling of Blast Furnace - A Tool for Improving .................................................................... 993
Nano Science and Technology on Coal and Carbon, Their Application in Iron and Steel Making ......................................................................................... 1005
Obtaining Inert Direct Reduced Iron by Means of the Dararexó Process ....................................... 1009
Perspectives of CO2 Emissions Reduction in Iron & Steel European Industries ......................... 1019
Proposed Procedure for Coal Evaluation According to Rank and Rheological Properties, A .......... 1031
Radiant Reduction of Iron Ore Fines ......................................................................................... 1051
Recupac Process, a New Friendly Environment Solution for Recycling EAF Dust .................. 1063
Relining and Enlargement of Rogesa No. 4 Blast Furnace in 2003 ............................................. 1065
Sesa Energy Recovery Cokemaking Technology Ten Years of Operation and Outlook for Future Development ........................................................................... 1077
Some New Technology for Minimizing GHG Emission in Chinese Steel Industry ............... 1089
Stamp Charging Technology at Tata Steel .................................................................................... 1093
State of the Art of Modeling, Control and Automation on Steelmaking ..................................... 1117
Supply of Coal for CST’s Coke Plant and the Influence of the Market in the Quality of the Coke ........................................................................................................ 1125
