
Single Piles and Pile Groups Under Lateral Loading

2nd Edition

Lymon C. Reese

*Academic Chair Emeritus
Department of Civil Engineering
The University of Texas at Austin*

William Van Impe

*Full Professor of Civil Engineering
Director Laboratory for Soil Mechanics
Ghent University, Belgium
Professor Catholic University Leuven, Belgium*

A BALKEMA BOOK

Contents

<i>Preface</i>	xv
<i>List of Symbols</i>	xvii
1 Techniques for design	1
1.1 Introduction	1
1.2 Occurrence of laterally loaded piles	2
1.3 Nature of the soil response	3
1.4 Response of a pile to kinds of loading	7
1.4.1 Introduction	7
1.4.2 Static loading	7
1.4.3 Cyclic loading	8
1.4.4 Sustained loading	10
1.4.5 Dynamic loading	10
1.5 Models for use in analyses of a single pile	11
1.5.1 Elastic pile and elastic soil	11
1.5.2 Elastic pile and finite elements for soil	13
1.5.3 Rigid pile and plastic soil	13
1.5.4 Characteristic load method	14
1.5.5 Nonlinear pile and p - y model for soil	15
1.6 Models for groups of piles under lateral loading	17
1.7 Status of current state-of-the-art	20
Homework problems for chapter 1	20
2 Derivation of equations and methods of solution	23
2.1 Introduction	23
2.2 Derivation of the differential equation	23
2.2.1 Solution of reduced form of differential equation	26
2.2.2 Solution of the differential equation by difference equations	32
2.3 Solution for $E_{py} = k_{py}x$	38
2.3.1 Dimensional analysis	39
2.3.2 Equations for $E_{py} = k_{py}x$	44
2.3.3 Example solution	46
2.3.4 Discussion	50
2.4 Validity of the mechanics	51
Homework problems for chapter 2	52

3	Models for response of soil and weak rock	53
3.1	Introduction	53
3.2	Mechanics concerning response of soil to lateral loading	54
3.2.1	Stress-deformation of soil	54
3.2.2	Proposed model for decay of E_s	55
3.2.3	Variation of stiffness of soil (E_s and G_s) with depth	56
3.2.4	Initial stiffness and ultimate resistance of p - y curves from soil properties	57
3.2.5	Subgrade modulus related to piles under lateral loading	64
3.2.6	Theoretical solution by Skempton for subgrade modulus and for p - y curves for saturated clays	66
3.2.7	Practical use of Skempton's equations and values of subgrade modulus in analyzing a pile under lateral loading	67
3.2.8	Application of the Finite Element Method (FEM) to obtaining p - y curves for static loading	68
3.3	Influence of diameter on p - y curves	69
3.3.1	Clay	69
3.3.2	Sand	69
3.4	Influence of cyclic loading	69
3.4.1	Clay	69
3.4.2	Sand	71
3.5	Experimental methods of obtaining p - y curves	72
3.5.1	Soil response from direct measurement	72
3.5.2	Soil response from experimental moment curves	72
3.5.3	Nondimensional methods for obtaining soil response	73
3.6	Early recommendations for computing p - y curves	73
3.6.1	Terzaghi	74
3.6.2	McClelland & Focht for clay (1958)	75
3.7	p - y curves for clays	75
3.7.1	Selection of stiffness of clay	76
3.7.2	Response of soft clay in the presence of free water	78
3.7.3	Response of stiff clay in the presence of free water	81
3.7.4	Response of stiff clay with no free water	88
3.8	p - y curves for sands above and below the water table	91
3.8.1	Detailed procedure	91
3.8.2	Recommended soil tests	94
3.8.3	Example curves	94
3.9	p - y curves for layered soils	94
3.9.1	Method of Georgiadis	95
3.9.2	Example p - y curves	96
3.10	p - y curves for soil with both cohesion and a friction angle	99
3.10.1	Background	99
3.10.2	Recommendations for computing p - y curves	99
3.10.3	Discussion	103
3.11	Other recommendations for computing p - y curves	104
3.11.1	Clay	104
3.11.2	Sand	105

3.12	Modifications to p - y curves for sloping ground	105
3.12.1	Introduction	105
3.12.2	Equations for ultimate resistance in clay	106
3.12.3	Equations for ultimate resistance in sand	107
3.13	Effect of batter	108
3.14	Shearing force at bottom of pile	108
3.15	p - y curves for weak rock	109
3.15.1	Introduction	109
3.15.2	Field tests	110
3.15.3	Interim recommendations for computing p - y curves for weak rock	110
3.15.4	Comments on equations for predicting p - y curves for rock	114
3.16	Selection of p - y curves	114
3.16.1	Introduction	114
3.16.2	Factors to be considered	114
3.16.3	Specific suggestions	115
	Homework problems for chapter 3	117
4	Structural characteristics of piles	119
4.1	Introduction	119
4.2	Computation of an equivalent diameter of a pile with a noncircular cross section	120
4.3	Mechanics for computation of M_{ult} and $E_p I_p$ as a function of bending moment and axial load	121
4.4	Stress-strain curves for normal-weight concrete and structural steel	125
4.5	Implementation of the method for a steel h-section	126
4.6	Implementation of the method for a steel pipe	129
4.7	Implementation of the method for a reinforced-concrete section	130
4.7.1	Example computations for a square shape	130
4.7.2	Example computations for a circular shape	132
4.8	Approximation of moment of inertia for a reinforced-concrete section	133
	Homework problems for chapter 4	134
5	Analysis of groups of piles subjected to inclined and eccentric loading	135
5.1	Introduction	135
5.2	Approach to analysis of groups of piles	136
5.3	Review of theories for the response of groups of piles to inclined and eccentric loads	137
5.4	Rational equations for the response of a group of piles under generalized loading	139
5.4.1	Introduction	139
5.4.2	Equations for a two-dimensional group of piles	143
5.5	Laterally loaded piles	147
5.5.1	Movement of pile head due to applied loading	147
5.5.2	Effect of batter	147

5.6	Axially loaded piles	148
5.6.1	Introduction	148
5.6.2	Relevant parameters concerning deformation of soil	148
5.6.3	Influence of method of installation on soil characteristics	150
5.6.4	Methods of formulating axial-stiffness curves	150
5.6.5	Calculation methods for load-settlement behaviour on the basis of in-situ soil tests	153
5.6.6	Differential equation for solution of finite-difference equation for axially loaded piles	157
5.6.7	Finite difference equation	159
5.6.8	Load-transfer curves	160
5.7	Closely-spaced piles under lateral loading	165
5.7.1	Modification of load-transfer curves for closely spaced piles	165
5.7.2	Concept of interaction under lateral loading	166
5.7.3	Proposals for solving for influence coefficients for closely-spaced piles under lateral loading	167
5.7.4	Description and analysis of experiments with closely-spaced piles installed in-line and side-by-side	170
5.7.5	Prediction equations for closely-spaced piles installed in-line and side-by-side	174
5.7.6	Use of modified prediction equations in developing p - y curves for analyzing results of experiments with full-scale groups of piles	175
5.7.7	Discussion of the method of predicting the interaction of closely-spaced piles under lateral loading	190
5.8	Proposals for solving for influence coefficients for closely-spaced piles under axial loading	190
5.8.1	Modification of load-transfer curves for closely spaced piles	190
5.8.2	Concept of interaction under axial loading	190
5.8.3	Review of relevant literature	191
5.8.4	Interim recommendations for computing the efficiency of groups of piles under axial load	194
5.9	Analysis of an experiment with batter piles	195
5.9.1	Description of the testing arrangement	195
5.9.2	Properties of the sand	196
5.9.3	Properties of the pipe piles	198
5.9.4	Pile group	199
5.9.5	Experimental curve of axial load versus settlement for single pile	200
5.9.6	Results from experiment and from analysis	200
5.9.7	Comments on analytical method	202
	Homework problems for chapter 5	202
6	Analysis of single piles and groups of piles subjected to active and passive loading	205
6.1	Nature of lateral loading	205
6.2	Active loading	205

6.2.1	Wind loading	205
6.2.2	Wave loading	207
6.2.3	Current loading	213
6.2.4	Scour	214
6.2.5	Ice loading	215
6.2.6	Ship impact	216
6.2.7	Loads from miscellaneous sources	218
6.3	Single piles or groups of piles subjected to active loading	218
6.3.1	Overhead sign	218
6.3.2	Breasting dolphin	222
6.3.3	Pile for anchoring a ship in soft soil	226
6.3.4	Offshore platform	232
6.4	Passive loading	243
6.4.1	Earth pressures	243
6.4.2	Moving soil	244
6.4.3	Thrusts from dead loading of structures	246
6.5	Single piles or groups of piles subjected to passive loading	246
6.5.1	Pile-supported retaining wall	246
6.5.2	Anchored bulkhead	251
6.5.3	Pile-supported mat at the Pyramid Building	257
6.5.4	Piles for stabilizing a slope	266
6.5.5	Piles in a settling fill in a sloping valley	272
	Homework problems for chapter 6	279
7	Case studies	281
7.1	Introduction	281
7.2	Piles installed into cohesive soils with no free water	282
7.2.1	Bagnolet	282
7.2.2	Houston	285
7.2.3	Brent Cross	288
7.2.4	Japan	290
7.3	Piles installed into cohesive soils with free water above ground surface	291
7.3.1	Lake Austin	291
7.3.2	Sabine	294
7.3.3	Manor	296
7.4	Piles installed in cohesionless soils	298
7.4.1	Mustang Island	298
7.4.2	Garston	301
7.4.3	Arkansas river	301
7.4.4	Roosevelt bridge	306
7.5	Piles installed into layered soils	307
7.5.1	Talisheek	307
7.5.2	Alcácer do Sol	311
7.5.3	Florida	312
7.5.4	Apapa	315
7.5.5	Salt Lake International Airport	315

7.6	Piles installed in c - ϕ soil	319
7.6.1	Kuwait	319
7.6.2	Los Angeles	320
7.7	Piles installed in weak rock	322
7.7.1	Islamorada	322
7.7.2	San Francisco	324
7.8	Analysis of results of case studies	327
7.9	Comments on case studies	328
	Homework problems for chapter 7	331
8	Testing of full-sized piles	333
8.1	Introduction	333
8.1.1	Scope of presentation	333
8.1.2	Method of analysis	333
8.1.3	Classification of tests	334
8.1.4	Features unique to testing of piles under lateral loading	334
8.2	Designing the test program	335
8.2.1	Planning for the testing	335
8.2.2	Selection of test pile and test site	335
8.3	Subsurface investigation	336
8.4	Installation of test pile	339
8.5	Testing techniques	340
8.6	Loading arrangements and instrumentation at the pile head	341
8.6.1	Loading arrangements	341
8.6.2	Instrumentation	344
8.7	Testing for design of production piles	348
8.7.1	Introduction	348
8.7.2	Interpretation of data	348
8.7.3	Example Computation	348
8.8	Example of testing a research pile for p - y curves	350
8.8.1	Introduction	350
8.8.2	Preparation of test piles	350
8.8.3	Test setup and loading equipment	352
8.8.4	Instrumentation	353
8.8.5	Calibration of test piles	357
8.8.6	Soil borings and laboratory tests	360
8.8.7	Installation of test piles	363
8.8.8	Test procedures and details of loading	366
8.8.9	Penetrometer tests	368
8.8.10	Ground settlement due to pile driving	371
8.8.11	Ground settlement due to lateral loading	371
8.8.12	Recalibration of test piles	373
8.8.13	Graphical presentation of curves showing bending moment	373
8.8.14	Interpretation of bending moment curves to obtain p - y curves	375
8.9	Summary	379
	Homework problems for chapter 8	379

9	Implementation of factors of safety	381
9.1	Introduction	381
9.2	Limit states	381
9.3	Consequences of a failure	382
9.4	Philosophy concerning safety coefficient	384
9.5	Influence of nature of structure	385
9.6	Special problems in characterizing soil	385
9.6.1	Introduction	385
9.6.2	Characteristic values of soil parameters	387
9.7	Level of quality control	387
9.8	Two general approaches to selection of factor of safety	388
9.9	Global approach to selection of a factor of safety	388
9.9.1	Introductory comments	388
9.9.2	Recommendations of the American Petroleum Institute (API)	389
9.10	Method of partial factors (psf)	390
9.10.1	Preliminary Considerations	390
9.10.2	Suggested values for partial factors for design of laterally loaded piles	390
9.10.3	Example computations	391
9.11	Method of load and resistance factors (LRFD)	393
9.11.1	Introduction	393
9.11.2	Loads addressed by the LRFD specifications	393
9.11.3	Resistances addressed by the LRFD specifications	394
9.11.4	Design of piles by use of LRFD specifications	394
9.12	Concluding comment	395
	Homework problems for chapter 9	395
10	Suggestions for design	397
10.1	Introduction	397
10.2	Range of factors to be considered in design	397
10.3	Validation of results from computations for single pile	398
10.3.1	Introduction	398
10.3.2	Solution of example problems	398
10.3.3	Check of echo print of input data	399
10.3.4	Investigation of length of word employed in internal computations	399
10.3.5	Selection of tolerance and length of increment	399
10.3.6	Check of soil resistance	400
10.3.7	Check of mechanics	400
10.3.8	Use of nondimensional curves	400
10.4	Validation of results from computations for pile group	401
10.5	Additional steps in design	401
10.5.1	Risk management	401
10.5.2	Peer review	401
10.5.3	Technical contributions	402
10.5.4	The design team	402

APPENDICES

A	Broms method for analysis of single piles under lateral loading	403
B	Nondimensional coefficients for piles with finite length, no axial load, constant E_p/I_p , and constant E_{py}	419
C	Difference equations for step-tapered beams on foundations having variable stiffness	429
D	Computer Program COM622	441
E	Non-dimensional curves for piles under lateral loading for case where $E_{py} = k_{py}x$.	451
F	Tables of values of efficiency measured in tests of groups of piles under lateral loading	461
G	Horizontal stresses in soil near shaft during installation of a pile	465
H	Use of data from testing uninstrumented piles under lateral loading to obtain soil response	471
I	Eurocode principles related to geotechnical design	477
J	Discussion of factor of safety related to piles under axial load	481
