Section 1: Process Modeling 1

   Authors: L. T. Fan & T. Zhang

   1 Introduction .......... 3
   2 Thermodynamic Foundations .......... 4
      2.1 Reference states .......... 4
         2.1.1 Standard state .......... 4
         2.1.2 Dead state .......... 5
      2.2 Balances of mass, energy, entropy-dissipation, and available energy .......... 11
         2.2.1 Mass balance .......... 13
         2.2.2 Energy balance .......... 14
         2.2.3 Entropy-dissipation balance .......... 16
         2.2.4 Available energy balance .......... 17
      2.3 First-law and second-law conservation (process) efficiencies .......... 18
      2.4 Simple systems .......... 22
         2.4.1 Thermal mixing .......... 22
            2.4.1.1 Numerical illustration .......... 24
         2.4.2 Biomass pyrolysis .......... 27
   3 Economic Foundations .......... 34
      3.1 Cost estimation .......... 35
         3.1.1 External cost .......... 35
         3.1.2 Internal cost .......... 37
Contents

4 Sustainability Assessment .................................................. 39
  4.1 Sustainability potential .............................................. 39
    4.1.1 Methodology .................................................. 40
      4.1.1.1 Determination of alternative synthetic routes ...... 41
      4.1.1.2 Hierarchical assessment of the sustainability-potential of alternative synthetic routes ........ 45
  4.1.2 Applications ................................................... 48
4.2 Sustainable Process Index ............................................. 49
4.3 AIChE Sustainability Index (SI) ..................................... 51
4.4 Hierarchical thermodynamic metrics ............................... 53
  4.4.1 Multi-scale system ............................................. 54
  4.4.2 Aggregation hierarchy ......................................... 54
  4.4.3 Spatial hierarchy .............................................. 56
5 Epilog ........................................................................... 59

2. Life Cycle Assessment (LCA) ............................................. 65
Authors: L. T. Fan & T. Zhang

1 Phases of Life Cycle Assessment (LCA) ............................... 65
  1.1 Phase 1: Goal and scope definition .............................. 65
  1.2 Phase 2: Inventory analysis ...................................... 66
  1.3 Phase 3: Impact assessment ....................................... 69
  1.4 Phase 4: Interpretation ............................................ 74
2 Calculating Environmental Burdens and Impacts in LCA — An Example ....................................................... 74
3 Thermodynamic Input-Output LCA (TIO-LCA) ....................... 75
4 Ecologically-Based Life Cycle Assessment (Eco-LCA) ............. 76

3. Transport Model for Nanofiltration and Reverse Osmosis System based on Irreversible Thermodynamic .......................... 79
Author: M. F. Chong

1 Introduction .................................................................... 79
2 Transport Mechanistic and Irreversible Thermodynamics based Transport Models for NF and RO membranes ........ 80
3 Fundamental of Irreversible Thermodynamics
  in Membrane System ...................................................... 81
## Contents

4 Spiegler–Kedem Model for Single Solute System .......................... 85
5 Spiegler–Kedem Model for Multiple Solute Systems ..................... 87
   5.1 Spiegler–Kedem model for binary solutes system ................. 88
   5.2 Extended Spiegler–Kedem model for multiple solute systems .......... 89
   5.3 Spiegler–Kedem model for multiple solutes system in differential equation form .......... 90
   5.4 Kedem–Katchalsky model for binary solutes system with one impermeable solute ............. 90
   5.5 Kedem–Katchalsky model for nonelectrolyte, dilute, multiple solute systems .................. 91
      5.5.1 Case study 1: Binary solutes system .................. 91
      5.5.2 Case study 2: Ternary solute system .................. 93
6 Process Design for Membrane Systems .................................. 96
7 Conclusion ........................................................................ 102

   Authors: H. H. Lou, S. Dusija, X. Li, J. L. Gossage & J. R. Hopper

1 Introduction .................................................................. 107
2 Polymerization Reaction and Polymer Properties ........................ 109
   2.1 Polymerization kinetics ........................................ 109
   2.2 Polymer properties ............................................. 111
   2.3 Polymer reactions in CSTR/batch reactors .................. 113
3 Case Study of Inhibition ................................................ 113
   3.1 Reaction kinetics for vinyl acetate polymerization ............ 115
   3.2 Selection of inhibitor ............................................ 115
   3.3 Simulation of reaction runaway and inhibition in batch process .......... 118
   3.4 Simulation of reaction runaway and inhibition for emergency shutdown of a CSTR .......... 122
   3.5 Effect on polymer properties for continuous operations ............ 124
4 Conclusions and Inference ............................................. 127
Contents

Section 2: Material Resource Conservation and Waste Reduction 131

5. Resource Conservation through Pinch Analysis 133

Author: D. C. Y. Foo

1 Introduction ............................................. 133
2 Design Tools for Resource Conservation ............... 134
   2.1 Targeting tools ..................................... 134
      2.1.1 Material recovery pinch diagram (MRPD) ...... 134
      2.1.2 Material surplus composite curves (MSCC) .... 136
      2.1.3 Cascade analysis technique .................... 137
2.2 Network Design Techniques .......................... 139
3 Examples of RCN ...................................... 140
   3.1 Water network synthesis ......................... 140
   3.2 Gas network ....................................... 144
   3.3 Property network .................................. 149
4 Further Improvement ................................... 155
5 Conclusion ........................................... 155

6. Optimal Water Network with Internal Water Mains and Its Industrial Application 159

Authors: X. Feng, J. Bai, R. Shen & C. Deng

1 Introduction ............................................. 159
2 Use of Water Mains .................................... 160
3 Optimal Design of Water Network with Internal Water Mains 162
   3.1 Superstructure of Water Network with Internal Water Mains .................. 162
   3.2 Mathematical Modeling for the Water Network
      Superstructure with Internal Water Mains ........... 164
      3.2.1 Determining the number of internal water mains 164
      3.2.2 Optimization on freshwater consumption .......... 164
      3.2.3 Structure constraints .......................... 166
      3.2.4 Solving the model ............................. 168
4 Optimal Design of Water Network Involving Wastewater Regeneration Recycle with Internal Water Mains ....... 168
   4.1 Superstructure of Water Networks Involving
      Wastewater Regeneration Recycle with Internal Water Mains .................. 168
Contents

4.2 Mathematical Modeling for the Water Network
Superstructure Involving Wastewater Regeneration
Recycle with Internal Water Mains .................. 169
4.2.1 Minimizing the freshwater consumption ...... 169
4.2.2 Minimizing regenerated water flowrate ....... 171
4.2.3 Minimizing regeneration load ................. 171

5 Industrial Applications ............................. 172
5.1 Optimizing Procedure ............................. 172
5.2 Rules to Determine Limiting Water Data ....... 173
5.3 Adjustment Principles ............................. 174

6 Case Study I: A PVC and Sodium Hydroxide Plant .. 175
6.1 Current Water System ............................. 175
6.2 Determining Contaminants and Limiting
Concentrations ....................................... 175
6.3 Optimizing Scheme with Water Reuse/Recycle .. 180

7 Case Study II: An Ammonia Plant .................. 184
7.1 Current Water System ............................. 184
7.2 Determine Contaminants and Limiting Concentrations 186
7.3 Optimizing Scheme with Water Regeneration
Reuse/Recycle ....................................... 188

7. Mathematical Models for Optimal Resource Utilization
in Process Industries ................................ 195

Author: A. Chakraborty

1 Introduction ....................................... 195
1.1 Mathematical modelling of the resource allocation
planning problem .................................... 198
1.2 Topological constraints ........................... 199
1.2.1 Uneconomical matches based on flowrates —
An example of conditional matching ............ 200
1.2.2 MINLP formulation with topological constraints 200
1.2.3 MILP formulation with topological constraints 202

2 Water Recycle Opportunities in Process Industries ... 204
2.1 Solution approaches .............................. 206
2.2 Example — A textile industry freshwater minimization
problem ............................................. 207
2.2.1 Graphical analysis ............................ 207
2.2.2 Linear programming ........................... 208
2.2.3 Interpretation of results based on heuristics ... 209
2.2.4 Constraints based on heuristics — An example of stream prioritization ... 210
2.2.5 The textile industry problem with topological constraints ... 210

2.3 Computation performance of MILP model on large-size problems — An example from the pulp & paper industry ... 211

3 Optimal Solvent Recovery from Pharmaceutical Wastes ... 213
3.1 Example — Waste management in a typical pharmaceutical company ... 215
3.1.1 Marketable product portfolio (sinks) ... 215
3.1.2 Base case policy ... 217
3.1.3 Comparison of base case policy with other waste management policies ... 217
3.1.4 Conditioning of wastes to marketable products ... 219
3.1.5 Economic potential analysis ... 221

4 Preconditioning of Resources Prior to Allocation — Synthesis of Optimal Mixer-Separator Networks ... 221
4.1 Pruning of search space ... 223
4.2 Mathematical model for optimal resource allocation with pre-conditioning ... 224
4.3 Illustrative example ... 225

5 Conclusions/Significance ... 227

8. Wastewater Minimisation in Batch Chemical Plants: Single Contaminant Media

Author: T. Majozi

1 Background to Wastewater Minimisation in Batch Plants ... 234
2 Problem Statement ... 235
3 Problem Superstructure ... 236
4 Mathematical Model ... 238
4.1 Water reuse/recycle module ... 238
4.2 Sequencing/scheduling module ... 244
4.2.1 Sequencing in the absence of reusable water storage ... 245
4.2.2 Sequencing in the presence of reusable water storage ... 246

10. Adaptive Swarm-Based Simulated Annealing for the Synthesis of Water Networks
   Author: R. R. Tan
   1 Introduction .......................................................... 291
   2 Simulated Annealing .................................................. 293
   3 Swarm Annealing I ................................................... 294
   4 Swarm Annealing II .................................................. 297
   5 Algorithm Implementation and Testing ............................. 298
   6 Test Problems .......................................................... 299
      6.1 Case 1 ............................................................... 299
      6.2 Case 2 ............................................................... 303
   7 Discussion of Results ................................................. 306
   8 Conclusion ............................................................. 307

11. Optimal Wastewater Network Design
    Authors: J. M. Jeżowski, G. Poplewski & I. Dzygyrey
    1 Introduction .......................................................... 311
    2 WWTN Problem Formulation and Description ....................... 314
    3 Literature Overview ................................................ 316
    4 Hybrid Approach for WWTN .......................................... 322
       4.1 Overview of the approach ...................................... 322
       4.2 Targeting stage .................................................. 323
       4.3 Structure development optimization stage ................. 325
       4.4 Final optimization stage ...................................... 326
       4.5 Example of application ......................................... 327
    5 Simultaneous Approach with the Use of Stochastic
       Optimization Method ................................................ 330
       5.1 Superstructure and optimization model ....................... 330
       5.2 Overview of solution approach ................................ 334
       5.3 Examples of application ....................................... 336

Section 3: Energy Conservation and Efficiency

12. Clean Energy and CO₂ Capture, Transport and Storage
    Authors: M. S. Ba-Shammakh, A. Elkamel, H. Hashim,
             P. Douglas & E. Croiset
    1 Introduction .......................................................... 351
Contents

2 Overview of Power Generation 352
  2.1 Fossil fuel power plants 353
  2.2 Hydroelectric power plant 353
  2.3 Nuclear power plants 354
  2.4 Renewable sources power plants 354

3 CO2 Reduction Options 355
  3.1 Power plant efficiency improvement 355
    3.1.1 Pulverized coal power plant (PC) 357
    3.1.2 Integrated gasification combined cycle (IGCC) 357
    3.1.3 Natural gas combined cycle (NGCC) 358

4 CO2 Capture and Sequestration 358
  4.1 CO2 capture 358
    4.1.1 Chemical solvent absorption 358
    4.1.2 Physical absorption 360
    4.1.3 Physical adsorption 360
    4.1.4 Cryogenic separation 360
    4.1.5 Membrane separation 361
    4.1.6 O2/CO2 combustion processes 361
    4.1.7 Chemical looping combustion 361
    4.1.8 Biological capture process 362
  4.2 Sequestration 362
    4.2.1 Geologic storage 363
      4.2.1.1 Depleted oil and gas reservoirs 363
      4.2.1.2 Enhanced oil recovery 363
      4.2.1.3 Deep saline formations 363
    4.2.2 Ocean storage 364

5 Optimization and Planning Models for Power Plants 365
6 Superstructure Representation 368
7 Mathematical Model Development 371
8 Case Study 382
9 Summary 393

Author: P. Varbanov

1 Introduction 399
2 Basics of P-graph 400
2.1 The need for advanced process network optimisation tools ........................................ 400
2.2 Process representation with P-graph ................................................................. 401
2.3 Advantages of the P-graph representation ......................................................... 402
2.4 Foundation of the P-graph framework: The axioms ........................................... 402
2.5 Algorithms for the network manipulation and optimisation ........................................ 403

3 Engineering Context: FCCC Systems and Biomass Resources ........................................ 405
3.1 Processing steps ......................................................................................... 405
3.2 Efficiency of FC and combined cycles ............................................................ 405

4 Modelling Procedures ......................................................................................... 406
4.1 General synthesis procedure ............................................................................. 406
4.2 Representation of the operating and capital costs ............................................. 407
4.3 Optimisation objective ............................................................................................. 407
4.4 Sensitivity analysis procedure ............................................................................. 407

5 Applying P-Graph: Heat and Power Generation Using FCCC ........................................ 408
5.1 Case study description ......................................................................................... 408
5.1.1 Materials and streams .................................................................................. 408
5.1.2 Candidate operating units .............................................................................. 408
5.2 Results and Discussion ....................................................................................... 411

6 Summary ...................................................................................................................... 418
7 Sources of Further Information .................................................................................. 419

Authors: R. Mahmud, D. Harell & M. El-Halwagi

1 Introduction .................................................................................................................................................. 423
2 Problem Statement ........................................................................................................................................ 427
3 Overall Approach ........................................................................................................................................ 429
3.1 Mass integration and heat integration approach ......................................................................................... 430
4 Steam Header Balance .................................................................................................................................. 437
5 Energy Integration Approach .......................................................................................................................... 439
6 Extractable Work Method .............................................................................................................................. 441
6.1 Case 1: Excess process steam without external fuel .................................................................................. 444
6.2 Case 2: Excess steam with external fuel ................................................................................................. 445
18. A Novel Design Procedure for Solar Thermal Systems
Author: S. Bandyopadhyay

1 Introduction .................................................. 561
2 Solar Thermal System Design .............................. 562
3 Mathematical Model ......................................... 563
4 Generation of Design Space ............................... 565
   4.1 Establishment of design limit based on load temperature ........................................ 567
   4.2 Establishment of design limit based on maximum temperature .................................... 568
   4.3 Overall design space and its significance ................................................................. 569
5 Conclusions ..................................................... 572

19. Energy Saving in Drying Processes
Authors: C. L. Law & A. S. Mujumdar

1 Introduction .................................................. 577
2 Why Conventional Dryers Have Low Energy Efficiency .................................................. 578
3 Classification .................................................. 579
   3.1 Direct firing ............................................... 579
   3.2 Electric heating .......................................... 580
   3.3 Heat recovery ............................................. 581
      3.3.1 Heat pump ......................................... 581
      3.3.2 Use of phase change material (PCM) .................................................. 582
   3.4 Control of dryer ......................................... 582
4 Case Studies .................................................. 582
   4.1 Direct firing ............................................... 583
      4.1.1 Case study: Fluidized bed dryer .................................................. 583

Appendix 1: The Procedure for Determining the Datum Level Materials
Authors: L. T. Fan & Tengyan Zhang

Appendix 2: Estimation of the Specific Chemical Enthalpy, Entropy, and Exergy (Availability)
Authors: L. T. Fan & Tengyan Zhang

Authors: L. T. Fan & Tengyan Zhang

Appendix 4: Estimation of Energy (Enthalpy) and Exergy (Availability) Contents in Structurally Complicated Materials
Authors: L. T. Fan & Tengyan Zhang

Appendix 5: Reaction-Network Synthesis Via the Graph-Theoretic Method Based on P-graphs: Vinyl-Chloride Synthesis
Authors: L. T. Fan & Tengyan Zhang

Appendix 6: Application of Sustainability Potential: Manufacture of Vinyl Chloride (C₂H₃Cl)
Authors: L. T. Fan & Tengyan Zhang
Appendix 7: Emergy and Exergy (Availability)  
Authors: L. T. Fan & Tengyan Zhang  

Appendix 8:  
Authors: H. H. Lou, S. Dusija, X. Li,  
J. L. Gossage & J. R. Hopper  

Appendix 9: Mathematical models via Lingo 8.0  
Authors: X. Feng, J. Bai, R. Shen & C. Deng  

Appendix 10: Brief Manual — How to Code WWTN Problem in OPTY-STO Modeling System  
Author: J. M. Jeżowski, G. Poplewski & I. Dzhygyrey
