### Contents

#### 1 Modern Steelmaking in Electric Arc Furnaces: History and Development

1.1 General Requirements to Steelmaking Units

1.1.1 Process Requirements

1.1.2 Economic Requirements

1.1.3 Environmental and Health and Safety Requirements

1.2 High-Power Furnaces: Issues of Power Engineering

1.2.1 Increasing Power of EAF Transformers

1.2.2 Specifics of Furnace Electrical Circuit

1.2.3 Optimum Electrical Mode of the Heat

1.2.4 Direct Current Furnaces

1.2.5 Problems of Energy Supply

1.3 The Most Important Energy and Technology Innovations

1.3.1 Intensive Use of Oxygen, Carbon and Chemical Heat

1.3.2 Foamed Slag Method

1.3.3 Furnace Operation with Hot Heel

1.3.4 Single Scrap Charging

1.3.5 Use of Hot Metal and Reduced Iron

1.3.6 Post-Combustion of CO Above the Bath

1.3.7 Increase in Capacity of Furnaces

1.3.8 Continuous Charging and Melting of Scrap in the Liquid Bath

#### 2 Electric Arc Furnace as Thermoenergetical Unit

2.1 Thermal Performance of Furnace: Terminology and Designations

2.2 External and Internal Sources of Thermal Energy: Useful Heat

2.3 Factors Limiting the Power of External Sources

2.4 Key Role of Heat Transfer Processes

Reference
3 The Fundamental Laws and Calculating Formulae of Heat Transfer Processes ................................................. 33
  3.1 Three Ways of Heat Transfer: General Concepts .......................................................... 33
  3.2 Conduction Heat Transfer ......................................................................................... 34
    3.2.1 Fourier's Law, Flat Uniform Wall. Electrical–Thermal Analogy ........................................ 34
    3.2.2 Coefficient of Thermal Conductivity ........................................................................ 37
    3.2.3 Multi-Layer Flat Wall ............................................................................................. 39
    3.2.4 Contact Thermal Resistance .................................................................................. 41
    3.2.5 Uniform Cylindrical Wall ....................................................................................... 42
    3.2.6 Multi-Layer Cylindrical Wall .................................................................................. 43
    3.2.7 Simplifying of Formulae for Calculation of Cylindrical Walls ..................................... 44
    3.2.8 Bodies of Complex Shape: Concept of Numerical Methods of Calculating Stationary and Non-Stationary Conduction Heat Transfer ................................ 45
  3.3 Convective Heat Exchange ....................................................................................... 49
    3.3.1 Newton's Law: Coefficient of Heat Transfer $\alpha$ .................................................. 49
    3.3.2 Two Modes of Fluid Motion .................................................................................... 50
    3.3.3 Boundary Layer ..................................................................................................... 50
    3.3.4 Free (Natural) Convection ....................................................................................... 52
    3.3.5 Convective Heat Transfer at Forced Motion ............................................................. 53
    3.3.6 Heat Transfer Between Two Fluid Flows Through Dividing Wall; Heat Transfer Coefficient $k$ ........................................................................................................ 55
  3.4 Heat Radiation and Radiant Heat Exchange .............................................................. 58
    3.4.1 General Concepts .................................................................................................... 58
    3.4.2 Stefan–Boltzmann Law; Radiation Density; Body Emissivity ........................................ 59
    3.4.3 Heat Radiation of Gases .......................................................................................... 62
    3.4.4 Heat Exchange Between Parallel Surfaces in Transparent Medium: Effect of Screens ........................................................................................................ 63
    3.4.5 Heat Exchange Between the Body and Its Envelope: Transparent Medium ................... 65
    3.4.6 Heat Exchange Between the Emitting Gas and the Envelope ...................................... 66

4 Energy (Heat) Balances of Furnace ............................................................................. 67
  4.1 General Concepts ....................................................................................................... 67
  4.2 Heat Balances of Different Zones of the Furnace ....................................................... 69
  4.3 Example of Heat Balance in Modern Furnace ............................................................... 71
  4.4 Analysis of Separate Items of Balance Equations ......................................................... 72
    4.4.1 Output Items of Balance .......................................................................................... 72
    4.4.2 Input Items of Balance ............................................................................................ 75
## 4.5 Chemical Energy Determination Methods
- 4.5.1 Utilization of Material Balance Data
- 4.5.2 About the So-Called "Energy Equivalent" of Oxygen
- 4.5.3 Calculation of Thermal Effects of Chemical Reactions by Method of Total Enthalpies

## 5 Energy Efficiency Criteria of EAFs
- 5.1 Preliminary Considerations
- 5.2 Common Energy Efficiency Coefficient of EAF and Its Deficiencies
- 5.3 Specific Coefficients $\eta$ for Estimation of Energy Efficiency of Separate Energy Sources and EAF as a Whole
- 5.4 Determining Specific Coefficients $\eta$
  - 5.4.1 Electrical Energy Efficiency Coefficient $\eta_{EL}$
  - 5.4.2 Fuel Energy Efficiency Coefficient of Oxy-Gas Burners $\eta_{NG}$
  - 5.4.3 Energy Efficiency Coefficient of Coke Charged Along with Scrap
  - 5.4.4 Determining the Specific Coefficients $\eta$ by the Method of Inverse Heat Balances
- 5.5 Tasks of Practical Uses of Specific Coefficients $\eta$

## 6 Preheating of Scrap by Offgases in Combination with Burners
- 6.1 Potentials and Limiting Factors
  - 6.1.1 Expediency of Heating
  - 6.1.2 Comparison of Consumptions of Useful Heat for Scrap Heating, Scrap Meltdown, and for Heating of Metal up to Tapping Temperature
  - 6.1.3 Reduction in Electrical Energy Consumption with High-Temperature Heating of Scrap: Calculation of Potentials
  - 6.1.4 Sample of Realization of High-Temperature Heating: Process BBC-Brusa
  - 6.1.5 Specifics of Furnace Scrap Hampering Its Heating
- 6.2 Heating on Conveyor
  - 6.2.1 Consteel Furnaces with Continuous Scrap Charging into the Bath
  - 6.2.2 Comparison of Melting Rates, Productivities, and Electrical Energy Consumptions Between the Consteel Furnaces and EAFs
  - 6.2.3 Scrap Preheating Temperature
