COMPUTERS IN RAILWAYS XIV

RAILWAY ENGINEERING DESIGN AND OPTIMIZATION

EDITORS

C.A. Brebbia
Wessex Institute of Technology, UK

N. Tomii
Chiba Institute of Technology, Japan

P. Tzieropoulos
Ecole Polytechnique Federale de Lausanne, Switzerland

J.M. Mera
Polytechnic University of Madrid, Spain

WIT PRESS Southampton, Boston
Contents

Section 1: Train control systems

Taking effective delay reduction measures and using delay elements as indices for Tokyo’s metropolitan railways
A. Yamamura, M. Koresawa, S. Adachi & N. Tomii ..............................................3

The hierarchical real-time control of high-speed trains for automatic train operation
Q. Y. Wang, P. Wu, Z. C. Liang & X. Y. Feng.......................................................17

Simple on-line observation and compensation of dead-time effects

Section 2: Communications and signalling

Innovative train control systems based on ERTMS and satellite-public TLC networks
F. Rispoli, A. Neri & F. Senesi..................................................................................51

Performance testing for high-speed train tracing and an approach-alarming system
J. Wang, B. Cai, J. Liu & W. Shangguan .................................................................63

Railway track layout modelling and its application to an automatic route setting system
H. Teshima, S. Hori, A. Shimura & N. Sato ..............................................................75

Standardization of logic for a constant warning time control at automatic level crossings
M. Teramoto, N. Miyaguchi, K. Kumasesaka, R. Ishima & Y. Fukuta ..................87

Black-box testing tool of railway signalling system software with a focus on user convenience

Section 4: Monitoring and maintenance

Modelling a temperature regime of a railway track structure and its comparison with the results of experimental measurements
S. Hodas & L. Ižvolt ................................................................. 253

Some experience and preliminary conclusions from the experimental monitoring of the temperature regime of a subgrade structure
L. Ižvolt, P. Dobeš & M. Pitoňák.................................................. 267

Reliability analysis and prediction of the failure process of some traction converters
M. Guida, P. Poli & G. Pulcini ...................................................... 279

Analysis of the influence of track quality for new and existing urban railway lines on train operation
Y. He & Z. Li ........................................................................ 291

The development of a Line-to-Ground Fault Detection System for a DC feeding system on a support pole
M. Shimbo .............................................................................. 303

A study of the elastic vertical displacement of a roadbed and HSB with an increase in speed on a high speed concrete track (HEMU-430x)
S. J. Han, K. Y. Eum, C. Y. Choi & J. H. Jung ........................................ 311

Monitoring of combustion locomotive state with the use of an on-board device
P. Boguś, J. Merkisz & R. Grzeszczyk ........................................... 319

Section 5: Operations quality

Evaluation of robustness indicators using railway operation simulation
L. W. Jensen, A. Landex & O. A. Nielsen ........................................ 329

Cyclic timetable improvement with train traffic data analysis
T. Graffagnino ......................................................................... 341

Zonal Operations: a method to rationalise operations
W. M. Guzman, K. J. Peszynski & L. W. Young ............................ 353

Towards a versatile European Driver Advisory System
D. Emery ................................................................................ 365

Optimization approaches of large rail-freight junctions
C. W. Flotzinger & M. Plasch ...................................................... 375
ComplexTrans: the global land transportation system  
J. Hofman ............................................................................ 387

Evaluation of the potential improvements in freight rail transport:  
the case of a Swedish rail company  
V. Roso, S. Hagman, M. de Nuria Calvo Mateo & N. Brnjac .......... 401

Section 6: Planning

Is it worth it? Sketch appraisal of the relevance of proposals for  
new rail lines  
P. Tzieropoulos & R. Gindrat ............................................. 415

Rail vehicles recycling  
A. Merkisz-Guranowska, J. Merkisz, M. Jacyna, D. Pyza  
& H. Stawecka ...................................................................... 425

A real option methodology to determine the optimal intervention windows  
for railway infrastructure  
N. Lethanh & B. T. Adey ..................................................... 437

The building and implementation of a track unit selection model  
for a comprehensive track maintenance plan  
J. F. Shen, Y. D. Xu & H. F. Li ............................................ 449

The catchment area of high architectural railway stations:  
an application of the Graham scan algorithm  
A. Carteni, G. Galante & I. Henke ........................................ 463

Digital Pattern Product Development: a pattern-driven approach  
for improving the bidding process in rail transport systems  
D. Sanzari, B. Brunetti & V. Torrieri .................................... 475

The impact of different maximum speeds on journey times, energy use,  
headway times and the number of trains required for Phase One  
of Britain’s High Speed Two line  

The object-oriented design of overhead contact line systems for  
railway and tram systems  
N. Berthold ......................................................................... 497

The use of microsimulation models for the planning and  
management of metro systems  
M. Ercolani, A. Placido, L. D’Acierno & B. Montella ............... 509
Particulate Matter concentrations in a new section of metro line:
a case study in Italy
A. Carteni & S. Campana .................................................. 523

Section 7: Timetable planning

Punctuality analysis by the microscopic simulation and visualization
of web-based train information system data
Y. Ochiai, J. Nishimura & N. Tomii ..................................... 537

Tuning delay-propagation models to meet practical planning
procedure requirements
T. Büker ........................................................................... 551

Supporting tools for automated timetable planning
N. Besinović, E. Quaglietta & R. M. P. Goverde............... 565

Shortening average trip times by adjusting stopping and
overtaking train stations
T. Katori, H. Kabumoto & T. Izumi .................................. 577

A case study of development of the transportation plan and the
operation control system for a high-speed railway
using a relational database

Dr.METRO: a demand-responsive metro-train operation
planning program
S. M. Oh & J. H. Min .......................................................... 595

The optimization of train timetable stop-skipping patterns
in urban railway operations
A. Jamili, S. F. Ghannadpour & M. Ghorshinezhad ............. 603

A new optimization model for railway slot allocation
B. H. Park, S.-H. Hong & C.-S. Kim ......................................... 613

Section 8: Rescheduling

The prediction of passenger flow under transport disturbance
using accumulated passenger data
T. Kunimatsu & C. Hirai .................................................. 623

An optimized, automatic TMS in operations in Roma Tiburtina
and Monfalcone stations
S. Foglietta, G. Leo, C. Mannino, P. Perticaroli & M. Piacentini ......... 635
Optimal rescheduling for the mixed passenger and freight line
B. Davydov, B. Dynkin & V. Chebotarev ...........................................649

The development of a rescheduling system for train traffic operation
H. Nakajima, A. Ishikawa, M. Nakamura & F. Henda...............................663

Generating a train rescheduling timetable considering the train routes
on tracks and car types
T. Katori, H. Yamazaki & T. Izumi....................................................675

Section 9: Energy supply and consumption

Optimisation of the DC railway power feeding system
using the embedded simulation technique
R. Takagi .........................................................................................689

Minimizing energy consumption in railways by voltage control
on substations
A. U. Raghunathan, T. Wada, K. Ueda & S. Takahashi ......................697

Impacts of energy saving strategies (ESSs) on rail services
and related effects on travel demand
G. Corapi, V. de Martinis, A. Placido & G. de Luca .........................709

Towards a simulation-based framework for evaluating energy-efficient
solutions in train operation
V. de Martinis, U. Weidmann & M. Gallo ...........................................721

Strategy of speed restriction allowing extended running times
to minimize energy consumption and passenger disutility
N. Kimura & M. Miyatake .................................................................733

Analysing the business case for introducing a 3 kV traction
power supply in Dutch railways
A. Zoeteman, F. ten Harve & T. Ploeg .............................................745

Optimizing the energy consumption and operational availability
of point heaters using weather forecasts
C. Weiß, T. Küsemann & K. A. Klinge .............................................757

Optimal train speed profiles by dynamic programming with
parallel computing and the fine-tuning of mesh
G. Matsuura & M. Miyatake ..........................................................767

An energy storage and rapid charge system using EDLC
for the Solar Light Rail
T. Kameya, J. Uddin, G. Suzuki & H. Katsuma .................................779
A genetic algorithm based train speed regulation optimization
C. Rongwu, Y. Tao & B. R. Bisrat .................................................................791

OPF for an HVDC feeder solution for railway power supply systems
J. Laury, L. Abrahamsson & S. Östlund .........................................................803

An SOS2-based moving trains, fixed nodes, railway power system simulator
L. Abrahamsson & L. Söder ...........................................................................813

Section 10: Safety

An analysis of different sensors for turnout detection for train-borne localization systems
D. Stein, M. Lauer & M. Spindler ..................................................................827

A fatigue limit diagram for plastic rail clips
S. Tamagawa, H. Kataoka & T. Deshimaru ..................................................839

A formal modeling methodology of the French railway interlocking system via HCPN
P. Sun, S. Collart-Dutilleul & P. Bon ............................................................849

Section 11: Railway vehicle dynamics

Prediction of long-term subgrade deformation under cyclic loadings with the implicit-explicit transition method using finite elements
K. Zhuang, G. Quanmei & W. Yang ...............................................................861

Dynamic analysis of railway bridges supported by a Winkler foundation under uniform partially distributed moving railway vehicles
J. A. Gbadeyan & M. C. Agarana .................................................................873

Fuzzy logic creep control for a 2D locomotive dynamic model under transient wheel-rail contact conditions
Y. Tian, W. J. T. Daniel, S. Liu & P. A. Meehan .............................................885

A study of an active steering bogie system for the curve negotiation on a sharp curved track
K. S. Sim, H. M. Hur, T. W. Park & M. J. Kim ..............................................897

Numerical simulation on wind pressure transients in high speed train tunnels
S.-W. Nam .......................................................................................................905

Author index .................................................................................................915
