

Controlled Thermonuclear Fusion

Jean Louis Bobin

Université Pierre et Marie Curie (Paris 6), France

Contents

Acknowledgments	v
Foreword	xi
Units	xv
1. Some Basic Physics	1
1. Atoms	1
2. Nuclei	3
3. Nuclear reactions	5
Reference	7
2. Thermonuclear Reactions	9
1. Fusion reactions	9
2. Hydrogen — the fuel of the Sun and other stars	11
3. Deuterium reactions	12
4. The thermonuclear regime	15
5. The ignition and sustainability of a thermonuclear reaction	17
6. The steady regime: the Lawson criterion	21

7. The explosive regime	23
References	25
3. Plasmas	27
1. The plasma state	27
2. Coulomb collisions in a plasma	30
3. Plasma creation	32
4. The magnetized plasma	33
5. Charged particle diffusion across a magnetic field	36
6. Plasma oscillations	37
7. Nonlinear waves and turbulence	39
8. Natural and fusion plasmas	40
References	41
4. Some Features of Magnetic Confinement	43
1. The basics	43
2. Current-carrying plasmas	44
3. Stability	46
4. Closed configurations	48
5. Equilibrium and stability of a current-carrying plasma ring	50
6. Charged particle trajectories in a current-carrying plasma ring	53
7. More instabilities in the torus	55
8. Compact tori	57
9. Stellarators	58
References	59
5. Tokamaks	61
1. The description and operation of a tokamak	61
2. Bigger and bigger, why?	63
3. Auxiliary heating	65
4. Three generations of tokamaks	71
5. Assessing tokamaks	74
References	78

6. ITER and Satellite Programs	79
1. A unifying project	79
2. How ITER looks like	82
3. ITER and safety	86
4. The question of materials	87
5. IFMIF (International Fusion Material Irradiation Facility)	91
6. Controversies	93
References	94
7. Some Features of Inertial Confinement — The Role of Lasers	95
1. Control of a micro-explosion	96
2. Dynamics of the compression	98
3. Interaction of a laser beam with a solid target	101
4. Instabilities	104
5. Indirect drive	106
6. Target design	109
7. Compression experiments	112
References	115
8. Big Drivers for Inertial Fusion	117
1. Laser energy and thermonuclear gain: the megajoule milestone	117
2. High-power lasers	120
3. Megajoule lasers	126
4. Beam to target	129
5. Spontaneous or triggered ignition?	133
6. An alternative solution: particle beams	136
7. The “Z-pinch” is back	139
References	143
9. Off The Main Trails	145
1. Fissile blankets	145
2. Hybrids with magnetic or inertial confinement	147

3. Cold fusion catalyzed by muons	152
4. Fuels beyond deuterium–tritium	154
References	158
10. The Fusion Reactor	159
1. Achilles and the tortoise, a paradox revisited	159
2. Conditions for a power plant	161
3. Energy cycles	165
4. Fusion in the nuclear fuel cycle	169
5. A glimpse of the future	171
6. A touch of economy	174
7. Tritium breeding and resources	176
References	178
Epilogue	179
Glossary	183
Acronyms	191
Selected Bibliography	193
Index	195
