Stochastic Modelling of Foams

André Liebscher

FRAUNHOFER VERLAG

Contents

Introduction	1
1 Stochastic Geometry in a Nutshell	5
1.1 Basic Morphological Concepts	6
1.2 Facts from Convex Geometry	8
1.3 Random Closed Sets	10
1.4 Point Processes	13
1.5 Statistics for Random Closed Sets	19
1.6 Random Laguerre Tessellations	24
1.7 Foundations of Image Analysis	28
2 Geometry of Foams	35
2.1 Dry Soap Froth	36
2.2 Structural Elements of Solid Foams	37
2.3 Simulation & Properties of Dry Foams	40
2.4 Deterministic Foam Models	43
3 Topologically Correct Foam Skeletons	47
3.1 Ultimate Skeleton	48
3.2 Influence of Structure Peculiarities	53
3.3 Watershed Skeleton	57
3.4 Graph Representation of Skeletons	65
3.5 Summary & Closing Remarks	68
4 Modelling the Cell System	71
4.1 Approximation of Laguerre Tessellations	73
4.2 Evaluation	79
4.3 Nuclei of Soap Froths	80
4.4 Summary & Closing Remarks	89
5 Stereological Reconstruction of Cellular Materials	91
5.1 Distance Measures for Sectional Tessellations	92
5.2 Annealing based Optimisation	95
5.3 Defining the Initial State	99
5.4 Evaluation	103
5.5 Application to Sintered Alumina – A Case Study	106

5.6	Summary & Closing Remarks	109
6	Modelling the Strut System	111
6.1	Adaptive Morphology based Strut Model	112
6.2	Local Spherical Contact Profile	113
6.3	Size Map of an Aluminium Foam – A Case Study	116
6.4	Summary & Closing Remarks	120
7	Microstructure Model of an Open Cell Copper Foam	123
7.1	Modelling the Cell System	124
7.2	Modelling the Strut System	126
7.3	Evaluation of the Mechanical Properties	129
7.4	Summary & Closing Remarks	132
	Bibliography	133
	About the Author	151
