University of Split, Croatia

C.A. Brebbia
Wessex Institute, UK
Contents

Section 1: Computational and experimental methods

Transmitted field in the lossy ground from ground penetrating radar (GPR) dipole antenna
*D. Poljak & V. Dorić* .................................................................................................................................................. 3

The Matrix Pencil method applied to smart monitoring and radar
*K. El Khamlichi Drissi & D. Poljak* ......................................................................................................................... 13

Redesign of ZIGZAG Chair by fiber reinforced plastics: fusing product design and engineering
*Y. Ohbuchi, H. Iida, T. Katayama, K. Tanaka, Y. Nakamura & H. Sakamoto* .............................................................. 25

Development of a new segment to improve the dispersion of a nanofiller by extensional flow in a co-rotating twin-screw extruder
*K. Matsumoto, Y. Arao & T. Tanaka* .......................................................................................................................... 33

Stochastic collocation analysis of the transient current induced along the wire buried in a lossy medium
*S. Sesnic, S. Lallechere, D. Poljak, P. Bonnet & K. E. K. Drissi* ......................................................................................... 47

Service life assessment of exterior lime-pozzolan renders containing ceramic powder
*J. Maděra, J. Kočí, E. Vejmelková, M. Čáchová, M. Jerman & R. Černý* ........................................................................... 59

Section 2: Advances in computational methods

Strong form collocation: input for optimization
*E. J. Kansa* ................................................................................................................................................................. 73
New two-step iteration process for solving the semiconductor plasma generation problem with arbitrary BC in 2D case
V. A. Trofimov, M. M. Loginova & V. A. Egorenkov .................................................. 85

Determination of the positive weather year for application in hygrothermal simulations
J. Koči, J. Maděra & R. Černý ........................................................................... 97

A higher-order finite volume method with collocated grid arrangement for incompressible flows

Section 3: Computer modelling

Numerical simulation of coupled problems
A. Harapin, J. Radnič & M. Sunara ........................................................................ 121

Modeling inside building electromagnetic wave propagation using a finite difference time domain method
J. Sosa-Pedroza, F. Martinez-Zúñiga & S. Coss-Domínguez ................................ 135

Control of the objects with a single output and with two or more input channels of influence
V. A. Zhmud, O. D. Yadrishnikov & V. M. Semibalut ..................................... 145

Validation of the direct numerical simulation code based on the criteria of force coefficient convergence
Z. B. Jiang, L. Z. Shao & F. Shao ........................................................................ 157

Simulation of nonorganic scintillation detector response for the problems of active interrogation by tagged neutron technology
V. F. Batyaev, S. G. Belichenko & R. R. Bestaev .............................................. 171

Modeling the economic growth of Arctic regions in Russia
N. Didenko & K. Kunze ......................................................................................... 179

Section 4: Simulation and forecasting

The building blocks of risk theory and methodology
N. Kovács, K. Koppány & D. R. Szabó ................................................................. 189

Integrated material process simulation for lightweight metal products
A. M. Horr .................................................................................................................. 201
Prediction of the outlet temperature of an experimental heat exchanger using artificial neural networks

Section 5: Fluid flow

Complementary studies on supersonic nozzle flow: Heterodyne interferometry, high-speed video shadowgraphy, and numerical simulation

Investigation of cross flow over a circular cylinder at low Re using the Immersed Boundary Method (IBM)
K. Rehman

Control of flow around a circular cylinder using a patterned surface
T. Hojo

Effect of structural forms on the performance of a jet pump for a deep well jet pump

Section 6: Materials characterisation

Computational modelling of elastomeric materials to fit experimental data
S. Hernandez, E. Menga & S. Moledo

Fatigue-induced grain growth and formation of slip bands in Cu processed by equal channel angular pressing
M. Goto, M. Baba, S. Z. Han, J. Kitamura, T. Yamamoto, J.-H. Ahn, T. Yakushiji, S. Kim & J. Lee

Characterization of the effect of brick-powder application in lime-based plasters
D. Koňáková, E. Vejmelková, M. Čáchtová, P. Reiterman, M. Keppert & R. Černý

Impact of coarse aggregate type and angularity on permanent deformation of asphalt concrete
L. Leon & R. Charles
Impact of metakaolin additive on residual mechanical properties of cement based composites loaded by high temperature
P. Reiterman, O. Holčapek, M. Jogl & P. Konvalinka .................................................. 315

Scaling resistance of special high performance composites with burnt clay additive
P. Reiterman, M. Jogl & P. Konvalinka ........................................................................ 325

Damage of porous stones by salt crystallization

Eutectic Na–Tl and Pb–Mg alloys as liquid-metal coolants for fast nuclear reactors
P. N. Alekseev, A. L. Shimkevich & I. Y. Shimkevich .............................................. 343

Section 7: Structural analysis

Dynamic characterization of the Basilica of S. Maria di Collemaggio after the earthquake of 2009 by means of operational modal analysis
D. Galeota, G. Sforza & L. Sbaraglia ......................................................................... 357

The tri-harmonic plate bending equation
I. D. Kotchergenko ................................................................................................. 367

Section 8: Heat transfer

Finite element modelling of the resistive heating of disposable molecular diagnostics devices
T. Pardy, T. Rang & I. Tulp .......................................................................................... 381

Approximate analytical method for thermal analysis of an annular fin having a step profile
B. Kundu, K.-S. Lee & A. Campo .............................................................................. 393

Numerical model analysis and experimental verification of a thermal regulation strategy for thermal vacuum test
W. J. Ding, W. Shan, Z. J. Wang & M. Liu ................................................................. 403

On-orbit temperature field calculation and analysis for large net-shape deployable antennas
Y. Q. Bi, J. Wang & X. Y. Li ...................................................................................... 411
The design of a small-scale multi-stage desalination plant driven by the exhaust of diesel generators
R. Jammoul & O. A. El-Samni ................................................................. 419

Numerical simulations of heat and mass transfer in the MOVPE process for obtaining high-quality nitride-based semiconductors
J. Skibinski, P. Caban, A. K. Lewandowska, T. Wejrzanowski & K. J. Kurzydlowski ................................................................. 433

Section 9: Environmental modelling and applications

Mathematical models supporting the monitoring of Civitavecchia harbour (Rome)

Application of IRF-Kriging to the mapping of environmental noise generated by quarrying plants
G. Alfaro Degan, D. Lippiello & M. Pinzari ................................................................. 455

Section 10: Air pollution modelling

Experimental research and numerical modelling of the movement of explosive and deflagrable clouds
Y. Zheng, F. Wang, P. Li, X. Li, W. Liu, G. Wu & H. Zhang ................................................................. 469

Atmospheric dispersion modeling to simulate rocket exhaust clouds

Section 11: Composite materials and structures

Performance of fibre-reinforced high-strength concrete with steel sandwich composite panels under static loading
C. Abraham & K. C. G. Ong ................................................................. 495

The post-buckling response of stiffened CFRP panels using a single-stringer compression specimen (SSCS): a numerical investigation
M. Ali Sadiq & H. Qing ................................................................. 507
Section 12: Applications in industry

Model of a system for the capacitive measurement of the height of liquids in metallic tanks
R. C. Callarotti ................................................................. 519

Interoperability test methodology for a train control system using interface channels
J.-G. Hwang, J.-H. Baek & H.-J. Jo......................................................... 531

Author index .................................................................................. 541
