

UNIVERSITY LECTURE SERIES VOLUME 64

Polynomial Methods in Combinatorics

Larry Guth

American Mathematical Society
Providence, Rhode Island

Contents

Preface	ix
Chapter 1. Introduction	1
1.1. Incidence geometry	2
1.2. Connections with other areas	4
1.3. Outline of the book	6
1.4. Other connections between polynomials and combinatorics	7
1.5. Notation	7
Chapter 2. Fundamental examples of the polynomial method	9
2.1. Parameter counting arguments	9
2.2. The vanishing lemma	10
2.3. The finite-field Nikodym problem	11
2.4. The finite field Kakeya problem	12
2.5. The joints problem	13
2.6. Comments on the method	15
2.7. Exercises	17
Chapter 3. Why polynomials?	19
3.1. Finite field Kakeya without polynomials	19
3.2. The Hermitian variety	22
3.3. Joints without polynomials	27
3.4. What is special about polynomials?	32
3.5. An example involving polynomials	33
3.6. Combinatorial structure and algebraic structure	34
Chapter 4. The polynomial method in error-correcting codes	37
4.1. The Berlekamp-Welch algorithm	37
4.2. Correcting polynomials from overwhelmingly corrupted data	40
4.3. Locally decodable codes	41
4.4. Error-correcting codes and finite-field Nikodym	44
4.5. Conclusion and exercises	45
Chapter 5. On polynomials and linear algebra in combinatorics	51
Chapter 6. The Bezout theorem	55
6.1. Proof of the Bezout theorem	55
6.2. A Bezout theorem about surfaces and lines	58
6.3. Hilbert polynomials	60

Chapter 7. Incidence geometry	63
7.1. The Szemerédi-Trotter theorem	64
7.2. Crossing numbers and the Szemerédi-Trotter theorem	67
7.3. The language of incidences	71
7.4. Distance problems in incidence geometry	75
7.5. Open questions	76
7.6. Crossing numbers and distance problems	79
Chapter 8. Incidence geometry in three dimensions	85
8.1. Main results about lines in \mathbb{R}^3	85
8.2. Higher dimensions	88
8.3. The Zarankiewicz problem	90
8.4. Reguli	95
Chapter 9. Partial symmetries	99
9.1. Partial symmetries of sets in the plane	99
9.2. Distinct distances and partial symmetries	101
9.3. Incidence geometry of curves in the group of rigid motions	103
9.4. Straightening coordinates on G	104
9.5. Applying incidence geometry of lines to partial symmetries	107
9.6. The lines of $\mathcal{L}(P)$ don't cluster in a low degree surface	108
9.7. Examples of partial symmetries related to planes and reguli	111
9.8. Other exercises	112
Chapter 10. Polynomial partitioning	113
10.1. The cutting method	113
10.2. Polynomial partitioning	116
10.3. Proof of polynomial partitioning	117
10.4. Using polynomial partitioning	121
10.5. Exercises	122
10.6. First estimates for lines in \mathbb{R}^3	126
10.7. An estimate for r -rich points	128
10.8. The main theorem	129
Chapter 11. Combinatorial structure, algebraic structure, and geometric structure	137
11.1. Structure for configurations of lines with many 3-rich points	137
11.2. Algebraic structure and degree reduction	139
11.3. The contagious vanishing argument	140
11.4. Planar clustering	143
11.5. Outline of the proof of planar clustering	144
11.6. Flat points	145
11.7. The proof of the planar clustering theorem	148
11.8. Exercises	149
Chapter 12. An incidence bound for lines in three dimensions	151
12.1. Warmup: The Szemerédi-Trotter theorem revisited	152
12.2. Three-dimensional incidence estimates	154

Chapter 13. Ruled surfaces and projection theory	161
13.1. Projection theory	164
13.2. Flecnodes and double flecnodes	172
13.3. A definition of almost everywhere	173
13.4. Constructible conditions are contagious	175
13.5. From local to global	176
13.6. The proof of the main theorem	183
13.7. Remarks on other fields	185
13.8. Remarks on the bound $L^{3/2}$	186
13.9. Exercises related to projection theory	187
13.10. Exercises related to differential geometry	189
Chapter 14. The polynomial method in differential geometry	195
14.1. The efficiency of complex polynomials	195
14.2. The efficiency of real polynomials	197
14.3. The Crofton formula in integral geometry	198
14.4. Finding functions with large zero sets	200
14.5. An application of the polynomial method in geometry	201
Chapter 15. Harmonic analysis and the Kakeya problem	207
15.1. Geometry of projections and the Sobolev inequality	207
15.2. L^p estimates for linear operators	211
15.3. Intersection patterns of balls in Euclidean space	213
15.4. Intersection patterns of tubes in Euclidean space	218
15.5. Oscillatory integrals and the Kakeya problem	222
15.6. Quantitative bounds for the Kakeya problem	232
15.7. The polynomial method and the Kakeya problem	234
15.8. A joints theorem for tubes	238
15.9. Hermitian varieties	240
Chapter 16. The polynomial method in number theory	249
16.1. Naive guesses about diophantine equations	249
16.2. Parabolas, hyperbolas, and high degree curves	251
16.3. Diophantine approximation	254
16.4. Outline of Thue's proof	258
16.5. Step 1: Parameter counting	259
16.6. Step 2: Taylor approximation	263
16.7. Step 3: Gauss's lemma	265
16.8. Conclusion	267
Bibliography	269
