Irreversible Decisions under Uncertainty

Optimal Stopping Made Easy

With 15 Figures

 Springer

Contents

Part I Discrete time – discrete space models. Finite time horizon

1	Introduction	3
1.1	Uncertainty and (partial) irreversibility	3
1.2	Option value of waiting	4
1.3	Bad news and good news principles	5
1.4	Optimal stopping and stochastic control: capital expansion program	6
1.5	Discounted utility anomalies	8
1.6	Models of uncertainty	9
1.7	Choice of the probability measure	11
1.8	Techniques used in the monograph	11
1.9	Overview of the monograph	14
1.9.1	Extensions	16
1.9.2	Notation	16
2	Real options and American options	17
2.1	Basic examples	17
2.1.1	Investment problem; two scenarios of the future	17
2.1.2	Investment problem as an American call option	20
2.1.3	Exit or option to abandon a stream	21
2.1.4	Exit as an American put option	22
2.2	Expected present value of a stream	22
2.3	Further examples and extensions	24
2.3.1	New job offer or option to swap streams of payoffs	24
2.3.2	Embedded options. Partially reversible investment	25
2.4	General analysis of the basic types of options	30
2.4.1	Options to acquire or abandon a perpetual stream vs. options with instantaneous payoffs	30

2.4.2	Stopping times and equivalence of an option to acquire a stream g_t and the option to abandon the stream $-g_t$	31
2.4.3	American options on a non-dividend paying stock	32
Problems	33
3	Risk-neutral pricing. Finite time horizon case	35
3.1	No-arbitrage and EMM	35
3.2	Replication and complete markets	38
3.3	European call and put options in a two-period model	38
3.4	Complete and incomplete markets	40
3.5	Multi-period model	41
3.5.1	Self-financing dynamic portfolios	41
3.5.2	No-arbitrage and EMM in a multi-period model	42
3.5.3	Replication and complete markets	42
3.5.4	Binomial model	43
3.5.5	Incomplete markets and the trinomial model	45
3.6	American options	45
Problems	47

Part II Discrete time – discrete space models.
Infinite time horizon

4	Random walks on \mathbb{Z}	51
4.1	Definition and main examples	51
4.2	Transition operator and EPV-operator \mathcal{E}	52
4.3	Bellman equation and calculation of $\mathcal{E}g$ using factorization	53
4.4	Calculation of $\mathcal{E}g$ for exponentially increasing g	57
Problems	58
5	Options in the binomial and trinomial models	59
5.1	EPV of a stream, which is abandoned when X_t falls to a certain level	59
5.2	Timing exit	62
5.3	Interpretation in terms of EPV-operators under supremum and infimum processes	65
5.4	Exit under supply uncertainty	66
5.5	Entry in the binomial and trinomial models	66
5.5.1	Entry under demand uncertainty	66
5.5.2	Entry under supply uncertainty	69
5.6	Perpetual American options	71
5.6.1	Perpetual American call options	71
5.6.2	Perpetual American put options	72
5.6.3	General exercise rules for perpetual American options in the binomial and trinomial models	74

5.7	Partially reversible investment	74
	Problems	77
6	General random walks on \mathbb{Z}: Option pricing	79
6.1	Wiener–Hopf factorization	79
6.1.1	Three forms of the Wiener–Hopf factorization	79
6.1.2	Uniqueness of the Wiener–Hopf factorization	80
6.2	Properties of EPV operators \mathcal{E}^+ and \mathcal{E}^-	82
6.2.1	Explicit formulas for \mathcal{E}^+ and \mathcal{E}^-	82
6.2.2	Action in $l_\infty(\mathbb{Z})$	84
6.2.3	The case of payoffs exponentially growing at infinity ...	86
6.3	EPVs of a stream and instantaneous payoff that are acquired or lost at a random time	89
6.3.1	EPV of a stream that is abandoned when the threshold is reached or crossed from above	89
6.3.2	EPV of a stream that is abandoned when the threshold is reached or crossed from below	91
6.3.3	EPV of a stream that is acquired when the threshold is reached or crossed from above	91
6.3.4	EPV of a stream that is acquired when threshold is reached or crossed from below	92
6.3.5	EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from above	92
6.3.6	EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from below	93
6.4	Main types of options. Optimality in the class of optimal stopping rules of the threshold type	93
6.4.1	Optimal time to abandon an increasing stream	93
6.4.2	Optimal time to abandon a decreasing stream	94
6.4.3	Optimal time to acquire an increasing stream	94
6.4.4	Optimal time to acquire a decreasing stream	95
6.4.5	Perpetual call-like American options	96
6.4.6	Perpetual put-like American options	96
6.5	Optimality in the class of all stopping times	97
6.5.1	General verification lemmas	97
6.5.2	Option to acquire an increasing stream	98
6.5.3	Option to acquire a decreasing stream	100
6.5.4	Option to abandon an increasing stream	100
6.5.5	Option to abandon a decreasing stream	101
6.5.6	Perpetual call-like American options	102
6.5.7	Perpetual put-like American options on a dividend-paying stock	102
6.5.8	Perpetual put-like American options on a non-dividend-paying stock	103
	Problems	104

Part III Discrete time – continuous space models

7 Random walks on \mathbb{R} 107

7.1 Definitions and examples 107

7.2 Transition operator and EPV-operator \mathcal{E} 109

7.3 Bellman equation and calculation of $\mathcal{E}g$ using factorization ... 111

Problems 116

8 Basic options in the model (7.5) 117

8.1 EPV of a stream, which is abandoned when X_t falls to a certain level 117

8.2 Timing exit 120

8.3 Continuous-pasting principle and smooth pasting principle ... 121

8.4 Continuous and discontinuous payoff functions 122

8.5 Interpretation in terms of the EPV-operators under the supremum and infimum processes 123

8.6 Exit under supply uncertainty 123

8.7 Entry 125

8.7.1 Entry under demand uncertainty 125

8.7.2 Entry under supply uncertainty 127

8.8 Perpetual American options 129

8.8.1 Perpetual American call options 129

8.8.2 Perpetual American put options 130

8.9 Expected waiting time 131

Problems 132

9 Optimal stopping for general random walks 133

9.1 Wiener-Hopf factorization 133

9.1.1 Three forms of the Wiener-Hopf factorization 133

9.1.2 Uniqueness of the Wiener-Hopf factorization 134

9.2 Properties of EPV operators \mathcal{E}^+ and \mathcal{E}^- 136

9.2.1 Explicit formulas for \mathcal{E}^+ and \mathcal{E}^- 136

9.2.2 Action in $\mathcal{L}_\infty(\mathbb{R})$ 139

9.2.3 The case of payoffs exponentially growing at infinity ... 141

9.3 EPVs of a stream and instantaneous payoff that are acquired or lost at a random time 144

9.3.1 Standing assumptions 144

9.3.2 EPV of a stream that is abandoned when the threshold is reached or crossed from above 145

9.3.3 EPV of a stream that is abandoned when the threshold is reached or crossed from below 146

9.3.4 EPV of a stream that is acquired when the threshold is reached or crossed from above 146

9.3.5 EPV of a stream that is acquired when the threshold is reached or crossed from below 147

9.3.6 EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from above 147

9.3.7 EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from below 148

9.4 Main types of options. Optimality in the class of optimal stopping rules of the threshold type 148

9.4.1 Standing assumptions and notation 148

9.4.2 Optimal time to abandon an increasing stream 148

9.4.3 Optimal time to abandon a decreasing stream 149

9.4.4 Optimal time to acquire an increasing stream 150

9.4.5 Optimal time to acquire a decreasing stream 150

9.4.6 Perpetual call-like American options 151

9.4.7 Perpetual put-like American options 151

9.5 Optimality in the class of all stopping times 152

9.5.1 General discussion and standing assumptions 152

9.5.2 Option to acquire an increasing stream 152

9.5.3 Option to acquire a decreasing stream 154

9.5.4 Option to abandon an increasing stream 154

9.5.5 Option to abandon a decreasing stream 155

9.5.6 Perpetual call-like American options 156

9.5.7 Perpetual put-like options on a dividend-paying stock .. 156

9.5.8 Perpetual put-like options on a non-dividend-paying stock 156

9.6 Investment lags 157

9.7 Incremental capital expansion 161

9.7.1 Investment threshold 161

9.7.2 Value of investment opportunity and firm's value 162

9.7.3 Capital stock dynamics 163

Problems 166

Part IV Continuous time - continuous space models

10 Brownian motion case 169

10.1 Main definitions 169

10.2 EPV-operators \mathcal{E}^\pm 172

10.2.1 Factorization of \mathcal{E} and EPV-operators \mathcal{E}^\pm 172

10.2.2 Main properties of operators \mathcal{E} and \mathcal{E}^\pm 173

10.2.3 The case of payoffs exponentially growing at infinity ... 175

10.3 EPV of a stream, which is abandoned when X_t falls to a certain level 177

10.4 Timing exit 179

10.5 Smooth pasting principle 181

10.6	Exit under supply uncertainty	181
10.7	Model entry problems	183
10.7.1	Entry under demand uncertainty	183
10.7.2	Investment lags	185
10.7.3	Entry under supply uncertainty	185
10.8	Perpetual American options	187
10.8.1	Perpetual American call options	187
10.8.2	Perpetual American put options	188
10.9	Embedded options	189
10.9.1	Debt-financed investment. Endogenous default	189
10.9.2	Competitive interest rate for lending	191
10.9.3	Debt-financed investment. Exogenous default	191
	Problems	192
11	General Lévy processes	193
11.1	Main definitions	193
11.2	Wiener–Hopf factorization	195
11.2.1	Three forms of the Wiener–Hopf factorization	195
11.2.2	Uniqueness of the Wiener–Hopf factorization	197
11.2.3	Analytic continuation of the factors $\kappa_q^\pm(z)$	199
11.3	Properties of the EPV-operators \mathcal{E} and \mathcal{E}^\pm	200
11.3.1	Explicit formulas for \mathcal{E}^+ and \mathcal{E}^-	200
11.3.2	Main properties and action in spaces of functions of exponential growth	202
11.4	EPVs of a stream and instantaneous payoff that are acquired or lost at a random time	203
11.4.1	Standing assumptions	203
11.4.2	EPV of a stream that is abandoned when the threshold is reached or crossed from above	203
11.4.3	EPV of a stream that is abandoned when the threshold is reached or crossed from below	205
11.4.4	EPV of a stream that is acquired when the threshold is reached or crossed from above	205
11.4.5	EPV of a stream that is acquired when the threshold is reached or crossed from below	206
11.4.6	EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from above	207
11.4.7	EPV of an instantaneous payoff that is acquired when the threshold is reached or crossed from below	207
11.5	Main types of options: Optimality in the class of optimal stopping rules of the threshold type	207
11.5.1	Optimal time to abandon an increasing stream	208
11.5.2	Optimal time to abandon a decreasing stream	208
11.5.3	Optimal time to acquire an increasing stream	209
11.5.4	Optimal time to acquire a decreasing stream	210

11.5.5	Perpetual call-like American options	211
11.5.6	Perpetual put-like American options	212
11.6	Optimality in the class of all stopping times	212
11.6.1	General verification lemmas	213
11.6.2	Option to abandon an increasing stream	215
11.6.3	Option to abandon a decreasing stream	216
11.6.4	Option to acquire an increasing stream	217
11.6.5	Option to acquire a decreasing stream	218
11.6.6	Put-like options	218
11.6.7	Call-like options	220
11.6.8	Options to swap a stream for another one	221
11.7	Influence of idiosyncratic uncertainty on exit and entry thresholds	222
	Problems	223
12	Embedded options	225
12.1	Entry with an embedded option to exit	225
12.2	Embedded options: Russian dolls	227
12.2.1	Expanding dolls	227
12.2.2	Contracting dolls	230
12.3	Capital expansion program	232
12.3.1	Timing an investment of a marginal unit of capital	232
12.3.2	Option value	235
12.3.3	Non-standard shape of the boundary between the action and inaction regions	236
12.4	New technology adoption	241
12.4.1	Model specification	241
12.4.2	One source of uncertainty	243
12.4.3	Two sources of uncertainty	246
12.4.4	Dependence of the new technology adoption threshold, A^* , on diffusion and jump uncertainty	247
	Problems	249

Part V Extensions

13	American options with finite time horizon	253
13.1	Call option	254
13.2	Put option	256
13.3	Gap between the early exercise boundary and strike	257
13.3.1	European options at expiry	258
13.3.2	Gap for the American call option	259
13.3.3	Gap for the American put option	260

14 Perpetual American and real options under Ornstein-Uhlenbeck processes	263
14.1 The model	263
14.2 Perpetual call option	264
14.3 Perpetual put option	266
14.4 Investment timing	268
14.5 Timing exit	269
14.6 Bad and good news principles as approximations	270
14.6.1 The case of a general Markov process	270
14.6.2 The case of the Ornstein-Uhlenbeck process	272
14.7 Options with instantaneous payoffs	274
14.7.1 Call option	274
14.7.2 Put option	276
