Essays on Investment and Technological Adoption

Bruno de Oliveira Cruz
Contents

1 Technological Progress and Investment: Microeconomic foundations and Macroeconomic Implications 9

1.1 Introduction\(^1\) ................................................................. 9

1.2 Lessons from micro data analysis ........................................... 11
   1.2.1 Characterization of microeconomic adjustment ................. 12
   1.2.2 Irreversibility and uncertainty .................................... 15

1.3 Vintage capital, embodied technical change and the 90's burst in ICT investment 20
   1.3.1 The basic framework ................................................... 21

1.4 Embodied Technological Progress: An example from Spanish Manufacturing Industry 25
   1.4.1 Database ...................................................................... 27
   1.4.2 Some Evidence on the Embodied Technological Progress ........ 32

1.5 Structure of The Thesis .................................................... 34

1.6 Appendix 1 - Sector Definition Nace 1974 ............................ 37

1.7 Appendix 2- Survival Analysis .......................................... 37

1.8 References ........................................................................ 40

2 Public Capital and Private Investment, a real option approach 44

2.1 Introduction\(^2\) ................................................................. 44

2.2 Providing public capital in a stochastic world ......................... 48

\(^1\)This Chapter is co-authored with Raouf Boucekkine.
\(^2\)This Chapter is co-authored with Ande Pommeret.
2.2.1 The program of the firm ............................................. 48
2.2.2 The program of the government ................................... 52
2.2.3 Deriving the optimal tax rate .................................... 56
2.2.4 Effect of uncertainty .............................................. 57
2.2.5 Comparative Output under Public and Private Provision .......... 62
2.2.6 Market power and public capital provision in a stochastic world ...... 63
2.2.7 The program of the firm ............................................. 63
2.2.8 The program of the government ................................... 64

2.3 Comparing the three cases ............................................ 66
2.4 Conclusion .............................................................. 67
2.5 References ............................................................. 68
2.6 Appendix 1: Deriving the optimal capital stock ....................... 71
2.7 Appendix 2: deriving the expected conditional consumer's surplus (following Bertola [1998]) ............................................. 72
2.8 Appendix 3: The case of Subsidies .................................. 74

3 Irreversible Investment with embodied technological Progress 77

3.1 Introduction\(^3\) ......................................................... 77
3.2 The Embodied technological model .................................. 81
3.3 Marginal value of capital ............................................ 83
3.4 Capacity choice with embodied technological progress ............... 86
  3.4.1 Utilization rule .................................................. 86
  3.4.2 Investment rule .................................................. 88
3.5 Optimal age of the oldest machine used ................................ 90
3.6 Optimal investment ................................................... 91
3.7 Illustration of the dynamics ......................................... 92
3.8 Observed Energy Price and Investment Behavior ..................... 94
3.9 Subsidizing energy saving capital accumulation: a real option approach 96

\(^3\)This Chapter is co-authored with André Pommerec.
