Abstract vii

Acknowledgements ix

1 General introduction 1
   1.1 Introduction to credit portfolio modeling and optimization 1
   1.2 Basel II framework for credit risk 2
   1.3 Outline of the dissertation 4

2 An overview of credit portfolio models 13
   2.1 Portfolio loss distribution 14
   2.2 Mixture models 15
   2.3 Finite state and threshold models 16
   2.4 Threshold models as Bernoulli mixture models 20
   2.5 Actuarial models 20
   2.6 Concluding remarks on Part I 22

3 Credit portfolio model for validating default risk 25
   3.1 A two-state default risk model 26
   3.2 Default and asset correlations 28
   3.3 Counting defaults 30
   3.4 Factor model calibration and validation 31
       3.4.1 The calibration problem 31
       3.4.2 Calibration with equity data 33
       3.4.3 Validation with historical default information 34

4 Estimators applied to default data 35
   4.1 Homogeneous cohorts 35
   4.2 Moment estimator and its variant 36
   4.3 Maximum likelihood estimator 37
   4.4 Theoretical analysis of the estimators 39
4.4.1 Moment estimator ................................................. 40
4.4.2 A variant of moment estimator ................................. 45
4.4.3 Maximum likelihood estimator .................................. 47

5 Model validation ......................................................... 49
5.1 Model validation based on default data .......................... 49
5.1.1 Correlations of rating cohorts ................................. 49
5.1.2 Correlations of industry cohorts ............................... 51
5.2 Validation based on rating data .................................. 54
5.2.1 Credit portfolio model for default and migration risk ....... 54
5.2.2 Counting rating migrations ..................................... 56
5.2.3 Maximum likelihood estimator for rating data .............. 57
5.2.4 Model validation with rating data ............................. 59
5.3 Model extensions: Relaxing the normal distribution assumption 60
5.4 Modeling the credit cycle ......................................... 61
5.5 Stability of asset correlations ..................................... 63
5.5.1 Monte Carlo studies ............................................. 65
5.5.2 PDs quantile approach ......................................... 68
5.6 Concluding remarks on Part II ................................... 70

6 Credit risk assessment and validation: Threshold accepting approach ............................................. 75
6.1 Regulatory issues and credit risk clustering .................... 77
6.1.1 General framework .............................................. 77
6.1.2 Credit risk clustering ............................................ 78
6.2 Optimization heuristics and credit risk clustering ............ 80
6.2.1 Threshold Accepting ............................................. 80
6.2.2 Basel II constraints .............................................. 81

7 Validation techniques and empirical analysis ......................... 83
7.1 Actual number of defaults validation ........................... 83
7.2 Unexpected losses validation ....................................... 85
7.3 Empirical analysis ................................................. 86
7.3.1 Data .......................................................... 86
7.3.2 Discussion of empirical results ............................... 87
7.4 Concluding remarks on Part III .................................. 89

8 Summary and outlook .................................................. 91
