# Contents

**Preface**

1. Financial markets for weather
   1.1 The use of weather derivatives ......................... 1
   1.2 Markets for weather derivatives ....................... 4
      1.2.1 Temperature derivatives .......................... 4
      1.2.2 Derivatives on wind speed ........................ 7
      1.2.3 Precipitation derivatives ........................ 8
      1.2.4 Other weather derivatives ........................ 9
   1.3 A brief outlook of the monograph ...................... 11

**Statistics of weather**

2. Data description and exploratory analysis ............... 17
   2.1 Data ................................................. 17
   2.2 Temperature ......................................... 18
   2.3 Wind ................................................ 19
   2.4 Precipitation ........................................ 22
   2.5 Spatial statistics and spatial-temporal modelling ..... 24
   2.6 Stochastic weather modelling – literature overview .... 29
      2.6.1 Temperature ...................................... 30
      2.6.2 Wind ............................................ 31
      2.6.3 Precipitation .................................... 33

3. Spatial-temporal modelling ................................ 35
   3.1 The modelling approach ................................ 35
3.2 Spatial-temporal model for temperature and wind speed 37
   3.2.1 Marginal modelling of temperature and wind speed 39
   3.2.2 Spatial modelling of temperature and wind speed 40
   3.2.3 Estimation of the marginal temperature model . 40
   3.2.4 Estimation of spatial temperature model . . 48
   3.2.5 A critical view on temporal temperature modelling 51
   3.2.6 Estimation of wind speed model ............... 54

3.3 Temporal modelling of precipitation ................. 66
   3.3.1 Estimation of precipitation time series model . . 67
   3.3.2 Validation of precipitation time series model . 70

Weather derivatives 75

4. Continuous-time models for temperature and wind speed 77
   4.1 CARMA models .................................. 77
   4.2 Simulation of CARMA processes .................. 82
   4.3 Linking CARMA to ARMA ........................ 85
   4.4 Recovering the states I: the Kalman filter .... 88
   4.5 Recovering the states II: an approxmative $L^1$-filter .... 91
   4.6 CARMA models for temperature and wind speed .... 96
      4.6.1 A model for temperature .................... 97
      4.6.2 A model for wind speed .................... 99
   4.7 Speed of reversion to the mean: the half-life ...... 103

5. Pricing of forward contracts on temperature and wind speed 107
   5.1 Theory on pricing forwards ........................ 107
      5.1.1 Pricing by burn analysis .................... 110
   5.2 A structure preserving class of measure changes .... 111
   5.3 Pricing temperature forwards ..................... 118
   5.4 Analysis of temperature futures prices ............ 124
      5.4.1 Temperature futures prices and the states of tempera-
      ture ........................................... 124
      5.4.2 The theoretical risk premium of temperature ... 128
      5.4.3 The Samuelson effect ......................... 132
   5.5 Pricing wind speed forwards ........................ 134

6. Extensions of temperature and wind speed models 139
   6.1 Stochastic temperature volatility .................. 139
6.2 Brownian semistationary processes ........................................... 143
6.3 Fractional models ................................................................. 147

7. Options on temperature and wind ................................................. 157
7.1 Options on temperature futures ................................................. 157
7.2 Options on wind speed futures ............................................... 166
7.3 Geographical hedging ................................................................ 170
7.3.1 A simple spatial-temporal model for temperature .................. 172
7.3.2 Computation of the optimal geographical hedge ..................... 174

8. Precipitation derivatives .............................................................. 179
8.1 A continuous-time model for precipitation ................................... 179
8.1.1 A class of independent increment processes .......................... 180
8.1.2 A stochastic model of precipitation ....................................... 182
8.2 Pricing derivatives on precipitation ........................................... 188
8.2.1 The Esscher transform for independent increment processes .... 189
8.2.2 Pricing ............................................................................. 192

9. Utility-based approaches to pricing weather derivatives ................. 197
9.1 Indifference pricing ................................................................... 197
9.1.1 Application to the pricing of rainfall derivatives ..................... 209
9.2 Fair pricing by benchmarking to a reference index ...................... 214
9.3 Pricing by marginal utility ........................................................ 216
9.4 The equilibrium approach by Cao and Wei ............................... 226

Appendix A List of abbreviations .................................................... 229

Bibliography ................................................................................. 231

Index .......................................................................................... 241
