

Econophysics and Physical Economics

Peter Richmond, Jürgen Mimkes,
and Stefan Hutzler

OXFORD
UNIVERSITY PRESS

Contents

Frequently used symbols	xiii
1 Introduction	1
1.1 Physicists, finance, and economics	1
1.2 Complex systems	7
1.3 Determinism and unpredictability	10
1.4 Thermodynamics and statistical mechanics	11
1.5 Economics, econophysics, and social systems	15
2 Reading financial data	18
2.1 Financial price data	18
2.2 Two types of investors	24
3 Basics of probability	27
3.1 Random variables	27
3.2 Adding random variables	34
3.3 Bayes' theorem	37
3.4 Appendix: The δ -function	40
4 Time dependent processes and the Chapman-Kolmogorov equation	41
4.1 Multi-time stochastic processes	41
4.2 Markov processes	43
4.3 The Chapman-Kolmogorov equation	44
5 The Langevin approach to modelling Brownian motion	46
5.1 Langevin equations	46
5.2 The velocity distribution of a Brownian particle	47
5.3 Modelling the position of a Brownian particle	49
5.4 Beyond Brownian motion	50
6 The Brownian motion model of asset prices	52
6.1 Modelling the distribution of returns	53
6.2 Evolution of prices	55
6.3 Comparing computer simulations for the geometric Brownian model with real stock data	57
6.4 Issues arising	63
7 Generalized diffusion processes and the Fokker-Planck equation	67
7.1 Introduction of n-th order diffusion constants	67
7.2 Evolution of the average of a random variable	69

7.3	Application to simple stock price model	70
7.4	The Fokker-Planck equation	70
7.5	Application: The Maxwell-Boltzmann distribution of velocities	71
7.6	The Langevin equation for a general random variable	71
7.7	Application to geometric Brownian motion model of stock prices	74
8	Derivatives and options	76
8.1	Forward contracts and call and put options	76
8.2	A simple example illustrating the effect of options	78
8.3	The theory of Black and Scholes	79
8.4	Implied volatility	84
8.5	Other developments and issues	85
9	Asset fluctuations and scaling	86
9.1	Stable distributions	87
9.2	Lévy distributions and their scaling properties	89
9.3	Analysis of empirical data	91
9.4	Small times and independence	95
9.5	The Heston model	97
10	Models of asset fluctuations	99
10.1	Generalized diffusion coefficients and the distribution function of returns	99
10.2	Correlation functions	103
10.3	Time dependent distribution function and scaling	104
10.4	Comparison with financial data	107
10.5	Volatility correlation function revisited	110
10.6	Non-Gaussian fluctuations and option pricing	112
11	Risk	113
11.1	Statistics of extreme events	113
11.2	The efficient portfolio	116
11.3	Portfolios and correlated assets	119
11.4	Portfolio analysis using minimum spanning trees	120
11.5	Portfolio analysis using random matrix theory	123
11.6	Practical issues	128
11.7	Appendix: Lagrange multipliers	128
11.8	Appendix: Wigner's semicircle law	129
12	Why markets crash	132
12.1	Market booms and crashes: some illustrations	132
12.2	A mathematical model of rational crashes	133
12.3	Continuous and discrete scale invariance	135
12.4	Agent models	138
12.5	What happens after a crash?	144
13	Two non-financial markets	146
13.1	An analysis of online betting markets	146

13.2	House price dynamics	149
14	An introduction to physical economics	154
14.1	Economic circuits	154
14.2	Two-dimensional calculus for economic systems	155
15	Laws of physical economics	162
15.1	The monetary circuit	162
15.2	First law of physical economics	165
15.3	Second law of physical economics	166
15.4	Integrating factor or dither	167
15.5	Production laws	168
15.6	Production functions	170
16	Markets	173
16.1	Ideal markets	173
16.2	Slowly changing productive markets	175
16.3	Common markets	178
16.4	Rapidly changing financial markets	179
17	A simple model of trade	181
17.1	Trade in a two island world	181
17.2	Computation of functions for demand and supply	183
17.3	Inflation	184
18	Production and economic growth	187
18.1	Carnot cycle	187
18.2	Economic growth	191
18.3	Stable economies	197
18.4	GDP, energy, pollution	197
19	Economics and entropy	200
19.1	Entropy and probability	200
19.2	Entropy as utility function	202
19.3	Optimisation problems	204
20	Approaches to non-equilibrium economics	209
20.1	Basic concepts	210
20.2	A generalization of thermodynamics to non-equilibrium systems	210
20.3	A generalized Boltzmann factor	212
20.4	Superstatistics and non-extensive statistical mechanics	214
20.5	Superstatistics for an ideal system	214
21	The distribution of wealth in society	216
21.1	Gibrat's model	217
21.2	The generalized Lotka-Volterra model	218
21.3	Collision models	219
21.4	Résumé	222

22	Conclusions and outlook	224
