Introduction

1 France, a particular “place” at a particular point in time
   1.1 The French automobile industry in crisis
   1.2 Do French customers accept vehicle electrification?
   1.3 A short history of policy efforts
   1.4 New policy departures in the early 2000s

2 Firms as major agents in pathways to electric drive technologies
   2.1 Car makers: technological choices of incumbents and newcomers
      2.1.1 The development of battery electric vehicles (BEVs)
      2.1.2 Hybridisation of the ICE – another path to the electric vehicle
   2.2 Agents in the development of battery technologies
      2.2.1 The trajectory of battery technologies in France
      2.2.2 Partnerships in battery technologies
      2.2.3 A renewed research base for electric drive technologies: major public players in battery R&D
   2.3 The indispensable role of other (than battery) suppliers in innovation and electrification

3 Framing an emerging market for electric vehicles

4 Conclusions
   4.1 The traits of a “French” trajectory in the electrification of vehicles
   4.2 Is this “French” trajectory sustainable?
   4.3 French players embedded in global linkages
