The Econometric Analysis of Recurrent Events in Macroeconomics and Finance

Don Harding and Adrian Pagan

Princeton University Press
Princeton and Oxford
## Contents

**Series Editors' Introduction**

**Preface**

### 1 Overview

1.1 Introduction 1

1.2 Describing the Events 2

1.3 Using the Event Indicators ("States") 10

1.4 Prediction of Recurrent Events 12

1.5 Conclusion 13

### 2 Methods for Describing Oscillations, Fluctuations, and Cycles in Univariate Series

2.1 Introduction 15

2.2 Types of Movements in Real and Financial Series 16

2.3 Prescribed Rules for Dating Business Cycles 26

2.4 Prescribed Rules for Dating Other Types of Real Cycles 38

2.5 Prescribed Rules for Dating Financial Cycles 40

2.6 Relations between Cycles and Oscillations 41

2.7 The Nature of $S_t$ and Its Modeling 45

2.8 Conclusion 50
3 Constructing Reference Cycles with Multivariate Information
3.1 Introduction
3.2 Determining the Reference Cycle via Phases
3.3 Combining Specific Cycle Turning Points
3.4 Finding Turning Points by Series Aggregation
3.5 Conclusion

4 Model-Based Rules for Describing Recurrent Events
4.1 Introduction
4.2 Dating Cycles with Univariate Series
4.3 Model-Based Rules for Dating Events with Multivariate Series
4.4 Conclusion

5 Measuring Recurrent Event Features in Univariate Data
5.1 Introduction
5.2 The Fraction of Time Spent in Expansions
5.3 Representing the Features of Phases
5.4 Amplitudes and Durations of Phases
5.5 The Shapes of Phases
5.6 The Diversity of Phases
5.7 Plucking Effects and Recovery Times
5.8 Duration Dependence in Phases
5.9 Conclusion

6 Measuring Synchronization of Recurrent Events in Multivariate Data
6.1 Introduction
6.2 Moment-Based Measures
6.3 Other Approaches to Measuring Synchronization
6.4 Synchronization and Model-Based Rules
6.5 Application to Synchronization of Industrial Production Cycles 116
6.6 Multivariate Synchronization 118
6.7 Comovement of Cycles 119
6.8 Conclusion 121

7 Accounting for Observed Cycle Features with a Range of Statistical Models 122
7.1 Introduction 122
7.2 U.S. Cycles as a Benchmark 123
7.3 The Business Cycle in a Range of Countries 129
7.4 Can U.S. Business Cycles Be Generated by Linear Models? 129
7.5 What Do Non-Linear Models Add? 132
7.6 Two Markov Switching Models 137
7.7 Using the Binary Indicators in Multivariate Systems 138
7.8 Conclusion 142

8 Using the Recurrent Event Binary States to Examine Economic Modeling Issues 143
8.1 Introduction 143
8.2 Estimating Univariate Models with Constructed Binary Data 145
8.3 What Do Variance Decompositions Tell Us About the Cycle? 150
8.4 The Role of Structural Shocks in Determining Cycle Features 152
8.5 Financial Effects and the Business Cycle 154
8.6 Conclusion 161

9 Predicting Turning Points and Recessions 163
9.1 Introduction 163
9.2 Bounding the Probability of the Occurrence of a Peak 166
9.3 Predicting Recessions with a Range of Variables 168
9.4 Changing the Event Defining Recessions and Turning Points 182
9.5 Conclusion 184
