List of abbreviations xviii

PART I
Theory and history 1

1 Global energy systems: a historical perspective 3
   1.1 The three pillars of human development and progress 3
   1.2 People in time and space 13
   1.3 Spatial scale, location and time scale 14
   1.4 Historical background since the concept of the ‘whole’ energy system started (1800–) 15

2 Scales and systems interactions across multiple energy domains 24
   2.1 Scales and systems integration from residential to national 24
   2.2 Scales and systems integration across multiple energy (and non-energy) domains 26

3 Whole energy system components 37
   3.1 Overview of the whole energy system 37
   3.2 Energy demand 40
   3.3 Energy supply 41
   3.4 Energy storage 43
   3.5 Super grids 49
   3.6 Synergies and hindrance 52
Contents

4 Brief overview of energy systems models and methodologies 57
   4.1 Current developments in energy systems models 57
   4.2 Grouping the underlying methodology of energy systems models 59

5 Discrepancies in energy systems models: actual vs forecast 62
   5.1 Primary energy demand: a comparison 65
   5.2 Primary energy mix 66
   5.3 Electricity generation 66
   5.4 Renewable energy share 69
   5.5 Environmental impact 69
   5.6 Conclusions 71

6 Drivers and challenges for energy systems modelling for the twenty-first century and of future WES integration 73
   6.1 Drivers of the future whole system scene 73
   6.2 The changing global energy scene 74
   6.3 Challenges in the energy systems 75
   6.4 Concluding remarks 76

7 Worldwide conversation about energy systems integration 78
   7.1 Worldwide conversation apropos energy systems integration 78
   7.2 Shortcomings of existing work 78

PART II
Modelling: challenges and discussions 81

8 Why do mathematical modelling? 83

9 Indicators and their role in models 85
   9.1 Energy efficiency indicators 85
   9.2 Resource efficiency indicators 87
   9.3 Indicators for sustainable development 87
   9.4 Indicators for the resource nexus 89
   9.5 Spatial indicators (GIS) 90

10 Research challenges 92
   10.1 Energy demand 92
   10.2 Energy supply 101
   10.3 Energy storage 103
   10.4 Power-to-gas 104
   10.5 Energy: centralisation versus decentralisation 109
   10.6 The need for a 'whole' integrated approach 110
   10.7 Scenarios: results vs reality 111
11 Performance of multi-scale energy systems 117

11.1 Modelling technology performance in buildings – the case of heat pumps 117
11.2 The concept of load profiles 120
11.3 Peak load factor 120
11.4 Modelling energy demand and supply at the temporal–spatial scale at different levels in the energy system 121
11.5 Interrelation with other resources: energy–water–land nexus 128
11.6 Regional-level/super grid energy systems 133
11.7 Case studies 134
11.8 Existing models and gaps 143
11.9 Proposed methodology and initial results 144
11.10 The global energy grid 147
11.11 How to unlock the potential of renewable energy around the world 148

12 Problems/gaps/research questions and issues 152

12.1 Data-related problems 152
12.2 Modelling-related problems 152

PART III
Energy policy, markets and geopolitics 153

13 Energy policies: what our past teaches us 155

13.1 Summary of energy policies: a global perspective 156
13.2 Traditional energy policies before the 1973 oil crisis 156
13.3 Western dominance over oil-rich nations’ production facilities 159
13.4 Energy policy reviews 160

14 Measures, practices and tools: utilising best practices to reduce air pollution and the carbon footprint worldwide 164

15 Electricity markets 166

15.1 Prototypes: electricity business and markets 167
15.2 Key market players 167
15.3 A case study: European electricity markets – liberalisation and integration process 168
15.4 Electricity market coupling 170
15.5 Market coupling: advantages and problems 170
15.6 Market coupling in the EU 172
15.7 Multiregional market coupling 172
15.8 Price coupling of regions within the EU 174
15.9 Conclusions 176
## Contents

16 Policy instruments and marketing of renewables in regions worldwide 180

16.1 Introduction 180
16.2 Current support mechanisms for deployment of RE 180
16.3 Regional case studies 183
16.4 Future perspectives on cooperation mechanisms 202

17 Energy resource use and geopolitics of trade 205

17.1 Introduction 205
17.2 Energy supply and political stability in Europe 207
17.3 The supply of oil and gas in Europe 208
17.4 Conclusions 209

**Appendix A:** constructing a metadatabase from open data sources 212
**Appendix B:** a compilation of open data sources 214
**Appendix C:** a compilation of energy systems models available online 216
