

Basic quantum electrodynamics required for the analysis of quantum antennas	p. 1-12
Introduction	p. 1
The problems to be discussed	p. 2
EM field Lagrangian density	p. 4
Electric and magnetic fields in special relativity	p. 4
Canonical position and momentum fields in electrodynamics	p. 4
The matter fields in electrodynamics	p. 5
The Dirac bracket in electrodynamics	p. 5
Hamiltonian of the em field	p. 6
Interaction Hamiltonian between the current field and the electromagnetic field	p. 7
The Boson commutation relations for the creation and annihilation operator fields for the EM field in momentum-spin domain	p. 8
Electrodynamics in the Coulomb gauge	p. 8
The Dirac second quantized field	p. 9
The Dirac equation in an EM field, approximate solution using Perturbation theory	p. 11
Electromagnetically perturbed Dirac current	p. 11
Effects of the gravitational field on a quantum antenna and some basic non-Abelian gauge theory	p. 13-44
The effect of a gravitational field on photon paths	p. 13
Interaction of gravitation with the photon field	p. 14
Quantum description of the effect of the gravitational field on the photon propagator	p. 15
Electrons and positrons in a mixture of the gravitational field and an EM field	p. 16
Quantum antennas in a background gravitational field	
Dirac equation in a gravitational field and a quantum white noise photon field described in the Hudson-Parthasarathy formalism	p. 17
Dirac-Yang-Mills current density for non-Abelian gauge theories	p. 18
Dirac brackets	p. 19
Harish-Chandra's discrete series representations of $SL(2,R)$ and its application to pattern recognition under Lorentz transformations in the plane	p. 21
Estimating the shape of the antenna surface from the scattered EM field when an incident EM field induces a surface current density on the antenna that is determined by Pocklington's integral equation obtained by setting the tangential component of the total incident plus scattered electric field on the surface to zero	p. 21
Surface current density operator induced on the surface of a quantum antenna when a quantum EM field is incident on it	p. 23
Summary of the second quantized Dirac field	p. 26
Electron propagator computation	p. 29
Quantum mechanical tunneling of a Dirac particle through the critical radius of the Schwarzschild blackhole	p. 31

Supersymmetry-supersymmetric current in an antenna comprising superpartners of elementary particles	p. 32
Conducting fluids as quantum antennas	p. 45-70
A short course in basic non-relativistic and relativistic fluid dynamics with antenna theory applications	p. 45
Flow of a 2-D conducting fluid	p. 54
Finite element method for solving the fluid dynamical equations	p. 55
Elimination of pressure, incompressible fluid dynamics in terms of just a single stream function vector field with vanishing divergence	p. 56
Fluids driven by random external force fields	p. 57
Relativistic fluids, tensor equations	p. 58
General relativistic fluids, special solutions	p. 59
Galactic evolution using perturbed fluid dynamics, dispersive relations. The unperturbed metric is the Robertson-Walker metric corresponding to a homogeneous and isotropic universe	p. 59
Magnetohydrodynamics-diffusion of the magnetic field and vorticity	p. 60
Galactic equation using perturbed Newtonian fluids	p. 61
Plotting the trajectories of fluid particles	p. 61
Statistical theory of fluid turbulence, equations for the velocity field moments, the Kolmogorov-Obukhov spectrum	p. 62
Estimating the velocity field of a fluid subject to random forcing using discrete space velocity measurements based on discretization and the Extended Kalman filter	p. 63
Quantum fluid dynamics. Quantization of the fluid velocity field by the introduction of an auxiliary Lagrange multiplier field	p. 63
Optimal control problems for fluid dynamics	p. 65
Hydrodynamic scaling limits for simple exclusion models	p. 66
Appendix: The complete fluid dynamical equations in orthogonal curvilinear coordinate systems specializing to cylindrical and spherical polar coordinates	p. 67
Quantum robots in motion carrying Dirac current as quantum antennas	p. 71-76
A short course in classical and quantum robotics with antenna theory applications	p. 71
A fluid of interacting robots	p. 73
Disturbance observer in a robot	p. 74
Robot connected to a spring mass with damping system	p. 75
Design of quantum gates using electrons, positrons and photons, quantum information theory and quantum stochastic filtering	p. 77-98
A short course in quantum gates, quantum computation and quantum information with antenna theory applications	p. 77
The Baker-Campbell-Hausdorff formula. $A, B$ are $n \times n$ matrices	p. 90
Yang-Mills radiation field (an approximation)	p. 91
Belavkin filter applied to estimating the spin of an electron in an external magnetic field. We assume that the magnetic field is $B_0(f) \in \mathbb{R}_3$	p. 93
Pattern classification for image fields in motion using Lorentz group representations 99-104	

SL(2,C), SL(2,R) and image processing	p. 99
Optimization problems in classical and quantum stochastics and information with antenna design applications	p. 105-120
A course in optimization techniques	p. 105
Group theoretical techniques in optimization theory	p. 113
Feynman's diagrammatic approach to computation of the scattering amplitudes of electrons, positrons and photons	p. 119
Quantum waveguides and cavity resonators	p. 121-124
Quantum waveguides	p. 121
Classical and quantum filtering and control based on Hudson-Parthasarathy calculus, and filter design methods 125-164	
Belavkin filter and Luc-Bouten control for electron spin estimation and quantum Fourier transformed state estimation when corrupted by quantum noise	p. 125
General Quantum filtering and control	p. 127
Some topics in quantum filtering theory	p. 127
Filter design for physical applications	p. 160
Gravity interacting with waveguide quantum fields with filtering and control	p. 165-176
Waveguides placed in the vicinity of a strong gravitational field	p. 165
Some study projects regarding waveguides and cavity resonators in a gravitational field	p. 167
A comparison between the EKF and Wavelet based block processing algorithms for estimating transistor parameters in an amplifier driven by the Ornstein-Uhlenbeck process	p. 169
Computing the Haar measure on a Lie group using left invariant vector fields and left invariant one forms	p. 170
How background em radiation affects the expansion of the universe	p. 171
Stochastic BHJ equations in discrete and continuous time for stochastic optimal control based on instantaneous feedback	p. 173
Quantum stochastic optimal control of the HP-Schrodinger equation	p. 174
Bath in a superposition of coherent states interacting with a system	p. 176
Basic triangle geometry required for understanding Riemannian geometry in Einstein's theory of gravity	p. 177-178
Problems in mathematics and physics for school students	p. 177
Geometry on a curved surface, study problems	p. 178
Design of gates using Abelian and non-Abelian gauge quantum field theories with performance analysis using the Hudson-Parthasarathy quantum stochastic calculus	p. 179-192
Design of quantum gates using Feynman diagrams	p. 179
An optimization problem in electromagnetism	p. 181
Design of quantum gates using non-Abelian gauge theories	p. 184
Design of quantum gates using the Hudson-Parthasarathy quantum stochastic Schrodinger equation	p. 185
Gravitational waves in a background curved metric	p. 185

Topics for a short course on electromagnetic field propagation at high frequencies	p. 187
Quantum gravity with photon interactions, cavity resonators with inhomogeneities, classical and quantum optimal control of fields	p. 191-218
Quantum control of the HP-Schrodinger equation by state feedback	p. 191
Some applications of poisson processes	p. 193
A problem in optimal control	p. 197
Interaction between photons and gravitons	p. 198
A version of quantum optimal control	p. 203
A neater formulation of the quantum optimal control problem	p. 208
Calculating the approximate shift in the oscillation frequency of a cavity resonator having arbitrary cross section when the medium has a small inhomogeneity	p. 210
Optimal control for partial differential equations	p. 215
Quantization of cavity fields with inhomogeneous media, field dependent media parameters from Boltzmann-Vlasov equations for a plasma, quantum Boltzmann equation for quantum radiation pattern computation, optimal control of classical fields, applications classical nonlinear filtering	p. 219-250
Computing the shift in the characteristic frequencies of oscillation in a cavity resonator due to gravitational effects and the effect of non-uniformity in the medium	p. 219
Quantization of the field in a cavity resonator having non-uniform permittivity and permeability	p. 221
Problems in transmission lines and waveguides	p. 222
Problems in optimization theory	p. 223
Another approach to quantization of wave-modes in a cavity resonator having non-uniform medium based on the scalar wave equation	p. 224
Derivation of the general structure of the field dependent permittivity and permeability of a plasma	p. 228
Other approaches to calculating the permittivity and permeability of a plasma via the use of Boltzmann's kinetic transport equation	p. 229
Derivation of the permittivity and permeability functions using quantum statistics	p. 231
Approximate discrete time nonlinear filtering for non-Gaussian process and measurement noise	p. 231
Quantum theory of many body systems with application to current computation in a Fermi liquid	p. 234
Optimal control of gravitational, matter and em fields	p. 237
Calculating the modes in a cylindrical cavity resonator with a partition in the middle	p. 239
Summary of the algorithm for nonlinear filtering in discrete time applied to fan rotation angle estimation	p. 240
Classical filtering theory applied to Levy process and Gaussian measurement noise. Developing the EKF for such problems	p. 243
Quantum Boltzmann equation for calculating the radiation fields produced by a plasma	p. 246
Classical and quantum drone design	p. 251-254

Project proposal on drone design for the removal of pests in a farm	p. 251
Quantum drones based on Dirac's relativistic wave equation	p. 252
Current in a quantum antenna	p. 255-260
Hartree-Fock equations for obtaining the approximate current density produced by a system of interacting electrons	p. 255
Controlling the current produced by a single quantum charged particle quantum antenna	p. 257
Photons in a gravitational field with gate design applications and image processing in electromagnetics	p. 261-288
Some remarks on quantum blackhole physics	p. 261
EM field pattern produced by a rotated and translated antenna with noise deblurring	p. 263
Estimation of the 3-D rotation and translation vector of an antenna from electromagnetic field measurements	p. 265
Mackey's theory of induced representations applied to estimating the Poincare group element from image pairs	p. 266
Effect of electromagnetic radiation on the expanding universe	p. 272
Photons inside a cavity	p. 274
Justification of the Hartree-Fock Hamiltonian using second order quantum mechanical perturbation theory	p. 276
Tetrad formulation of the Einstein-Maxwell field equations	p. 277
Optimal quantum gate design in the presence of an electromagnetic field propagating in the Kerr metric	p. 280
Maxwell's equations in the Kerr metric in the tetrad formalism	p. 286
Quantum fluid antennas interacting with media	p. 289-303
Quantum MHD antenna in a quantum gravitational field	p. 289
Applications of scattering theory to quantum antennas	p. 290
Wave function of a quantum field with applications to writing down the Schrodinger equation for the expanding universe	p. 292
Simple exclusion process and antenna theory	p. 294
MHD and quantum antenna theory	p. 295
Approximate Hamiltonian formulation of the diffusion equation with applications to quantum antenna theory	p. 297
Derivation of the damped wave equation for the electromagnetic field in a conducting media in quantum mechanics using the Lindblad formalism	p. 298
Boson-Fermion unication in quantum stochastic calculus	p. 302
References	p. 304
