

Introduction: How to write history of biology
Subjectivity and bias Why study the history of biology?
The place of biology in the sciences and its conceptual structure
The nature of science Method in science
The position of biology within the sciences
How and why is biology different?
Special characteristics of living organisms
Reduction and biology Emergence
The conceptual structure of biology
A new philosophy of biology
The changing intellectual milieu of biology Antiquity
The Christian world picture
The Renaissance
The discovery of diversity Biology in the Enlightenment
The rise of science from the seventeenth to the nineteenth century
Divisive developments in the nineteenth century
Biology in the twentieth century
Major periods in the history of biology
Biology and philosophy Biology today
Diversity Of Life
Macrotaxonomy, the science of classifying Aristotle
The classification of plants by the ancients and the herbalists
Downward classification by logical division
Pre-Linnaean zoologists Carl Linnaeus Buffon
A new start in animal classification
Taxonomic characters
Upward classification by empirical grouping
Transition period (1758-1859)
Hierarchical classifications
Grouping according to common ancestry
The decline of macrotaxonomic research Numerical phenetics Cladistics
The traditional or evolutionary methodology
New taxonomic characters
Facilitation of information retrieval
The study of diversity
Microtaxonomy, the science of species
Early species concepts
The essentialist species concept
The nominalistic species concept Darwin's species concept
The rise of the biological species concept
Applying the biological species concept to multidimensional species taxa

The significance of species in biology

Evolution

Origins without evolution

The coming of evolutionism

The French Enlightenment

Evolution before Darwin Lamarck Cuvier England

Lyell and uniformitarianism Germany

Charles Darwin Darwin and evolution

Alfred Russel Wallace

The publication of the Origin

Darwin's evidence for evolution and common descent

Common descent and the natural system

Common descent and geographical distribution

Morphology as evidence for evolution and common descent

Embryology as evidence for evolution and common descent

The causation of evolution: natural selection

The major components of the theory of natural selection

The origin of the concept of natural selection

The impact of the Darwinian revolution

The resistance to natural selection Alternate evolutionary theories

Diversity and synthesis of evolutionary thought

The growing split among the evolutionists

Advances in evolutionary genetics

Advances in evolutionary systematics

The evolutionary synthesis

Post-synthesis developments

Molecular biology Natural selection

Unresolved issues in natural selection

Modes of speciation Macroevolution

The evolution of man Evolution in modern thought

Variation and its Inheritance

Early theories and breeding experiments

Theories of inheritance among the ancients Mendel's forerunners
