

WATER ON MARS

MICHAEL H. CARR

*U.S. Geological Survey
Menlo Park, California*

New York Oxford
Oxford University Press
1996

CONTENTS

1. Introduction, 3

- Historical background, 3
- Astronomical properties, 5
- The atmosphere, 8
- Surface temperatures and thermal inertias, 13
- Surface topography, 14
- Geology, 16
 - Relative age*, 16
 - Highlands and plains*, 18
 - Volcanism*, 20
 - Tectonism*, 22
 - Poles*, 22
 - Views from the surface*, 24
- SNC meteorites, 24
- Interior structure and heat flow, 28

2. The Present Water Cycle and Stability Relations, 30

- Circulation of water in the atmosphere, 30
- Stability of ground ice, 33
- Megaregolith holding capacity for groundwater and ground ice, 35
- Loss of ground ice to the atmosphere, 40
- Migration of water through the megaregolith, 43
- Summary, 45

3. Outflow Channels, 47

- Distribution and characteristics, 47
- Origin of outflow channels, 53
- Discharge rates and sediment transport, 59
- Lakes in the canyons, 63
- Terminal lakes, 65
 - Polygonally fractured ground*, 65
 - Mottled plains*, 65
 - Strandlines*, 65
 - Terraced and stepped massifs*, 66
 - Backflow features*, 66
 - Layered sediments*, 67
- Sublimation from lakes, 68
- Summary, 69

4. Valley Networks, 71

- Distribution, 72
- Network topology, 76

Drainage density, 79
 Network ages, 79
 Networks—channels or valleys?, 80
 Fretted channels, 81
 Channels on volcanoes, 90
 Canyon walls, 92
 Freezing of streams, 93
 Origin of valley networks, 95

5. Ground Ice, 100

Terrestrial permafrost, 100
 Rheology of ice, 101
 Debris flows and terrain softening, 102
 Lobate debris aprons, 102
 Terrain softening, 104
 Rampart craters, 109
 Other possible indicators of ground ice, 112
 Polygonal fractures, 112
 Patterned ground, 113
 Fracturing and flow, 114
 Thermokarst, 114
 Miscellaneous, 116
 Glaciers, 116
 Volcano-ice interactions, 120
 Summary, 122

6. Climate change, 123

Quasi-periodic climate change, 123
 Changes in orbital and rotational motions, 123
 Potential effects of changes in orbital and rotational motions, 125
 Polar layered terrains, 129
 Observational evidence for long-term climate changes, 131
 Valley networks, 132
 Erosion rates, 133
 Other possible evidence for climate change, 135
 Geologic and geochemical estimates of the surface inventory of CO₂, 136
 Mechanisms for climate change, 138
 Greenhouse warming, 139
 Maintenance of an early thick atmosphere, 141
 Recharge of the atmosphere with CO₂, 142
 Episodic ocean hypothesis, 143
 Summary, 144

7. Accretion and Evolution of Water, 146

Geochemical and geophysical processes affecting the acquisition and redistribution of water, 148
 Chondritic meteorites, 148
 Chemical fractionation, 148
 Hydrodynamic escape, 149
 Impact erosion, 151
 Outgassing, 152
 Upper atmosphere losses, 153

Accretion, 153
 Water retention after core formation, 156
 Estimates of H₂O and CO₂ from argon and nitrogen in the atmosphere, 158
 Estimates of H₂O from D/H ratio, 161
 Geologic estimates of the surface inventory of water, 165
 Summary, 166

8. Implications for Life, 170

Origin and early history of life on Earth, 171
 Molecular phylogeny and the origin of life, 175
 Life in extreme environments, 176
 The early martian atmosphere, 178
 Hydrothermal systems, 178
 Possible martian habitats, 180
 Ancient hydrothermal and lake deposits, 180
 Lakes within the canyons, 180
 Post-Noachian volcanic regions, 182
 High-latitude water rich deposits, 182
 Summary, 182

9. Future Mars Exploration, 184

Science goals, 185
 Mode of formation and evolution of the solid planet, 186
 Climate change, 186
 Biologic history, 187
 Precursor knowledge for human missions, 187
 Exploration approaches, 188
 Orbital remote sensing, 188
 Simple landers, 189
 Geoscience stations, 189
 Seismic network, 190
 Meteorology stations, 190
 Penetrators, 190
 Balloons, 190
 Polar sounder, 190
 Advanced missions, 190
 Long-range rovers, 190
 Mars sample return, 191
 Future prospects, 192

10. Summary and Conclusions, 197

Stability relations, 197
 Outflow channels, water inventories, and deuterium, 198
 Accretion, differentiation, and the early atmosphere, 200
 Valley networks, climate change, and carbonates, 201
 Lakes, hydrothermal systems, and life, 202
 The future, 203
