

Interpolation, Identification, and Sampling

Jonathan R. Partington

*School of Mathematics
University of Leeds*

CLARENDON PRESS • OXFORD

1997

Contents

1	Function spaces and operators	1
1.1	Fourier series and approximate identities	1
1.2	Fourier and Laplace transforms	13
1.3	Function spaces on the disc	18
1.4	Function spaces on the half-plane	24
1.5	Blaschke products and zero sets	27
1.6	Toeplitz and Hankel operators	32
2	Interpolation and recovery	43
2.1	Classical interpolation problems	43
2.2	Zero sets for the disc algebra	51
2.3	Extension and recovery in the disc algebra	55
2.4	Totik's recovery theorem	64
2.5	Interpolating sequences	70
3	Worst-case identification of functions	84
3.1	Causal operators and linear systems	84
3.2	Worst-case identification in the disc algebra	87
3.3	Two-stage algorithms	90
3.4	Model sets and Chebyshev identification	95
3.5	Band-limited identification on the circle	101
4	Approximation and interpolation	106
4.1	n -Widths and approximation	106
4.2	Hankel-norm approximation	113
4.3	Bases and decompositions in the disc algebra	123
4.4	IBC and optimal algorithms	134
4.5	Interpolation and validation	139
5	Hilbert space methods	144
5.1	Reproducing kernel Hilbert spaces	144
5.2	The matching pursuit algorithm	148
5.3	Minimal-norm interpolation	151
5.4	Least squares methods	154
5.5	Frames and wavelets	163
6	Convolution operators	174
6.1	Worst-case identification of convolutions	174

6.2	Probabilistic inequalities	176
6.3	Chebyshev identification and input design	181
6.4	Identification in ℓ_2	190
6.5	IBC and validation	197
7	Sampling	204
7.1	The Paley–Wiener spaces	204
7.2	Regular sampling	208
7.3	General sampling	217
7.4	Balayage	228
8	Applications	236
8.1	Linear systems	236
8.2	H_∞ control	241
8.3	Examples of identification	248
	References	251
	Index	263
