

Astronomy: Principles and Practice

Fourth Edition

A E Roy, PhD, FRAS, FRSE, FBIS

*Professor Emeritus in Astronomy, Honorary Lecturer
and Senior Research Fellow, University of Glasgow*

D Clarke, PhD, MInstP, FRAS

*Honorary Research Fellow in Physics and Astronomy,
University of Glasgow*

IoP

**Institute of Physics Publishing
Bristol and Philadelphia**

Contents

Foreword to fourth edition	xvii
Foreword to third edition	xix
Foreword to second edition	xx
Foreword to first edition	xxi
Acknowledgments	xxiii
PART 1	
Introduction Chapters 1–6	1
1 Naked eye observations	3
1.1 Introduction	3
1.2 Instantaneous phenomena	4
1.2.1 Day	4
1.2.2 Night	4
1.3 A few hours	4
1.3.1 Day	4
1.3.2 Night	5
1.4 A month	5
1.5 A year	6
2 Ancient world models	9
3 Observations made by instruments	13
3.1 The subjectivity of simple measurements	13
3.2 Instrumentation in astronomy	14
3.3 The role of the observer	16
4 The nature of the observables	18
4.1 Introduction	18
4.2 Macroscopic bodies	18
4.3 Atomic particles	19
4.4 Electromagnetic radiation	19
4.4.1 The wave nature of radiation	19
4.4.2 The photon nature of radiation	21
4.4.3 Polarization	22

5	The astronomer's measurements	24
5.1	Introduction	24
5.2	Direction of arrival of the radiation	24
5.3	Brightness	27
5.3.1	Factors affecting brightness	27
5.3.2	The magnitude system	29
5.4	Polarization	30
5.5	Time	31
6	The night sky	33
6.1	Star maps and catalogues	33
6.2	Simple observations	35
PART 2		
The Celestial Sphere and Elementary Celestial Mechanics		Chapters 7–14
7	The geometry of the sphere	43
7.1	Introduction	45
7.2	Spherical geometry	45
7.3	Position on the Earth's surface	47
7.3.1	GPS satellites	50
7.4	Spherical trigonometry	51
7.4.1	The formulas	51
7.4.2	Proof of cosine formula	52
7.4.3	Proof of sine formula	54
7.4.4	Proof of the analogue to the cosine formula	54
7.4.5	Proof of the four-parts formula	55
7.5	Other formulas of spherical trigonometry	55
7.6	The small spherical triangle	55
	Problems—Chapter 7	57
8	The celestial sphere: coordinate systems	59
8.1	Introduction	59
8.2	The horizontal (<i>alt-azimuth</i>) system	59
8.3	The equatorial system	61
8.4	Southern hemisphere celestial spheres	62
8.5	Circumpolar stars	63
8.6	The measurement of latitude and declination	65
8.7	The geocentric celestial sphere	67
8.8	Transformation of one coordinate system into another	68
8.9	Right ascension	71
8.10	The Sun's geocentric behaviour	72
8.11	Sunset and sunrise	74
8.12	Megalithic man and the Sun	76
8.13	Sidereal time	78
8.14	The ecliptic system of coordinates	79
8.15	Galactic coordinates	80
	Problems—Chapter 8	86

9	The celestial sphere: timekeeping systems	88
9.1	Introduction	88
9.2	Sidereal time	88
9.3	Mean solar time	92
9.4	The relationship between mean solar time and sidereal time	95
9.5	The civil day and timekeeping	96
9.6	The Greenwich date and zone time (with date)	98
9.7	The tropical year and the calendar	99
9.8	The Julian date	99
9.9	Dynamical time	100
9.10	The Earth's geographical zones	101
9.11	The seasons	103
9.12	Twilight	105
	Problems—Chapter 9	110
10	The reduction of positional observations: I	112
10.1	Introduction	112
10.2	Atmospheric refraction	112
10.2.1	The laws of refraction	112
10.2.2	Astronomical refraction	114
10.2.3	Measurement of the constant of refraction	116
10.2.4	Horizontal refraction	117
10.3	Correction for the observer's altitude	118
10.4	Geocentric parallax	120
10.5	The semi-diameter of a celestial object	122
10.6	Measuring distance in the Solar System	124
10.6.1	The Moon	124
10.6.2	The planets	125
10.7	Stellar parallax	126
10.7.1	Stellar parallactic movements	126
10.7.2	The parallactic ellipse	127
10.7.3	The measurement of stellar parallax	128
10.7.4	The parsec	130
10.7.5	Extrasolar planets	130
	Problems—Chapter 10	131
11	The reduction of positional observations: II	133
11.1	Introduction	133
11.2	Stellar aberration	133
11.3	The velocity of light	135
11.4	The angle of aberration	136
11.5	The constant of aberration	137
11.6	Diurnal and planetary aberration	138
11.7	Precession of the equinoxes	140
11.8	Measuring the positions of Υ and the celestial equator	142
11.9	Effect of precession on a star's equatorial coordinates	143
11.10	The cause of precession	144
11.11	Nutation	145
11.12	The tropical and sidereal years	147
	Problems—Chapter 11	147

12 Geocentric planetary phenomena	149
12.1 Introduction	149
12.2 The Ptolemaic System	150
12.3 The Copernican System	151
12.4 The astronomical discoveries of Galileo	152
12.5 Planetary configurations	153
12.6 The synodic period	154
12.7 Measurement of planetary distances	156
12.8 Geocentric motion of a planet	158
12.9 Stationary points	159
12.10 The phase of a planet	162
12.11 Improvement of accuracy	164
Problems—Chapter 12	164
13 Celestial mechanics: the two-body problem	166
13.1 Introduction	166
13.2 Planetary orbits	166
13.2.1 Kepler's laws	166
13.2.2 Kepler's first law	167
13.2.3 Kepler's second law	168
13.2.4 Kepler's third law	169
13.3 Newton's laws of motion	170
13.4 Newton's law of gravitation	170
13.5 The <i>Principia</i> of Isaac Newton	173
13.6 The two-body problem	174
13.6.1 Equations of motion	174
13.6.2 The solution of the two-body problem	176
13.6.3 The energy integral	176
13.6.4 The velocity of a planet in its orbit	177
13.6.5 The period of revolution of a planet in its orbit	179
13.6.6 Newton's form of Kepler's third law	179
13.6.7 Measuring the mass of a planet	180
13.6.8 Co-periodic orbits	181
13.7 Solar radiation pressure	182
13.8 The astronomical unit	183
Problems—Chapter 13	184
14 Celestial mechanics: the many-body problem	185
14.1 Introduction	185
14.2 The elements of an orbit	185
14.3 General properties of the many-body problem	187
14.4 General perturbation theories	187
14.5 Special perturbation theories	189
14.5.1 General principles	189
14.5.2 Chaos and unpredictability	190
14.6 Dynamics of artificial Earth satellites	193
14.6.1 Forces acting on artificial satellites	193
14.6.2 Effect of the Earth's shape on a satellite orbit	193
14.6.3 Effect of the Earth's atmosphere on a satellite orbit	194
14.7 The geostationary satellite	195
14.8 Interplanetary transfer orbits	195

14.8.1	Introduction	195
14.8.2	Transfer between circular, coplanar orbits about the Sun	196
14.8.3	Transfer between particles moving in circular, coplanar orbits	199
14.8.4	Transfer between planets	203
14.8.5	Interplanetary billiards	204
	Problems—Chapter 14	205

PART 3

Observational Techniques Chapters 15–23 207

15	The radiation laws	209
15.1	Introduction	209
15.2	The velocity of light	210
15.3	Kirchhoff's law	211
15.4	Solid angle	214
15.5	Black body radiation	215
15.5.1	The basic behaviour	215
15.5.2	Stefan's law	217
15.5.3	Wien's displacement law	218
15.6	Magnitude measurements	218
15.6.1	The stellar output	218
15.6.2	Stellar magnitudes	218
15.7	Spectral lines	220
15.7.1	Introduction	220
15.7.2	The Bohr hydrogen atom	221
15.7.3	The hydrogen spectrum	223
15.7.4	Molecular spectra	226
15.8	Basic spectrometry	227
15.8.1	Simple considerations	227
15.8.2	The Doppler shift	227
15.8.3	Natural line width	229
15.8.4	Thermal line broadening	230
15.8.5	Collisional line broadening	230
15.8.6	Line broadening by rotation	230
15.9	Polarization phenomena	231
15.10	The Zeeman effect	234
	Problems—Chapter 15	236
16	The optics of telescope collectors	238
16.1	Introduction	238
16.2	The telescope collector	239
16.3	The telescope and the collected energy	241
16.3.1	Stellar brightness	241
16.3.2	Brightness of an extended object	242
16.3.3	Illumination	244
16.4	Telescope resolving power	245
16.5	Refractors	249
16.5.1	Objectives	249
16.5.2	Chromatic aberration	250
16.5.3	Spherical aberration	253

16.5.4	Coma	254
16.5.5	Astigmatism	255
16.5.6	Curvature of field	256
16.5.7	Distortion of field	257
16.6	Transmission efficiency of the refractor	257
16.7	Reflectors	258
16.7.1	Principles	258
16.7.2	Newtonian reflectors	259
16.7.3	Cassegrain reflectors	259
16.8	Transmission efficiency of the reflector	261
16.9	Comparison of refractors and reflectors	263
	Problems—Chapter 16	271
17	Visual use of telescopes	272
17.1	Magnifying power	272
17.2	Visual resolving power	274
17.3	Magnification limits	276
17.4	Limiting magnitude	277
17.5	Eyepieces	278
17.6	Micrometer eyepieces	280
17.7	Solar eyepieces	281
	Problems—Chapter 17	282
18	Detectors for optical telescopes	283
18.1	The optical spectrum	283
18.2	Spectral sensitivity	283
18.3	Quantum efficiency	283
18.4	The eye as a detector	284
18.5	The photographic plate	285
18.5.1	Introduction	285
18.5.2	Spatial resolution	286
18.5.3	Speed	286
18.5.4	Spectral sensitivity	287
18.6	Photographic photometry	287
18.7	Photographic efficiency	291
18.8	Limiting magnitude	291
18.9	Unsharp masking	293
18.10	Photoelectric devices	293
18.10.1	Introduction	293
18.10.2	Spectral sensitivity	293
18.10.3	Quantum efficiency	293
18.11	The photomultiplier	294
18.11.1	Its principle	294
18.11.2	DC amplification	296
18.11.3	Photon-counting photometry	297
18.11.4	Dark background	298
18.12	Limiting magnitude	298
18.13	Image converters	299
18.14	TV systems and other detectors	300
18.15	Charge coupled devices	300
	Problems—Chapter 18	304

19	Astronomical optical measurements	305
19.1	Introduction	305
19.2	Positional measurements	305
19.3	Broadband spectral photometry	306
19.4	Standard magnitude systems	307
19.5	Colour indices	308
19.6	Bolometric magnitudes	310
19.7	Disturbances caused by the atmosphere	311
	19.7.1 Introduction	311
	19.7.2 Extinction	312
	19.7.3 Atmospheric turbulence	315
19.8	Image photometry	319
	19.8.1 Photographic photometry	319
	19.8.2 Photoelectric photometry	321
	19.8.3 CCD photometry	322
	19.8.4 Polarimetry	323
19.9	Spectrometry	323
	Problems—Chapter 19	329
20	Modern telescopes and other optical systems	330
20.1	The new technologies	330
	20.1.1 Active optics	330
20.2	Adaptive optics	332
20.3	Measurements at high angular resolution	333
	20.3.1 Michelson's stellar interferometer	333
	20.3.2 Aperture synthesis	335
	20.3.3 The intensity interferometer	335
	20.3.4 Lunar occultation method	336
	20.3.5 Speckle interferometry	337
20.4	The Schmidt telescope	339
20.5	The transit telescope	342
20.6	Zenith tubes	343
20.7	Portable positional instruments	344
	20.7.1 The theodolite	344
	20.7.2 The sextant	345
20.8	The coelostat	347
20.9	The coronagraph	348
21	Radio telescopes	352
21.1	Introduction	352
21.2	Antennas	353
21.3	Antenna design	356
	21.3.1 The basic dipole	356
	21.3.2 The half-wave dipole	357
	21.3.3 The Yagi antenna	358
	21.3.4 Antenna arrays	358
21.4	Parabolic dishes	360
21.5	Horn collectors	362
21.6	Interferometry	362
	21.6.1 A basic interferometer	362
	21.6.2 A phase-switched interferometer	363

21.6.3	Very long baseline interferometry	366
21.7	Aperture synthesis	366
21.7.1	Lunar occultations	368
21.8	Polarization	371
21.9	Radar observations	372
	Problems—Chapter 21	373
22	Telescope mountings	374
22.1	Optical telescopes	374
22.2	Equatorial mountings	376
22.2.1	The German mounting	376
22.2.2	The fork mounting	376
22.2.3	The English mounting	376
22.2.4	The coudé system	377
22.3	Telescope domes	378
22.4	Radio telescopes	380
23	High energy instruments and other detectors	381
23.1	Introduction	381
23.2	X-ray astronomy	381
23.2.1	X-ray energies	381
23.2.2	X-ray telescopes	382
23.2.3	X-ray spectrometry	385
23.2.4	X-ray detectors	386
23.3	γ -ray astronomy	388
23.3.1	Detectors and satellites	388
23.3.2	γ -ray spectral lines	389
23.3.3	Čerenkov radiation and detection	390
23.4	Ultraviolet astronomy	391
23.5	Infrared astronomy	391
23.6	Millimetre astronomy	393
23.7	Neutrino astronomy	396
23.7.1	Introduction	396
23.7.2	Neutrino telescopes	396
23.8	Gravitational radiation	397
23.9	The missing mass problem	399
 PART 4		
Experimental Work Chapter 24		401
24	Practical projects	403
24.1	Introduction	403
24.2	The Sun as a timekeeper	403
24.2.1	A horizontal sundial	404
24.2.2	A vertical sundial	405
24.2.3	A noon-marker	406
24.3	The Sun as a position finder	407
24.3.1	Simple determination of latitude	408
24.3.2	Theodolite observations	409
24.3.3	Sextant observations	412
24.4	Observational radio astronomy	423

24.4.1	Observing the Sun	425
24.4.2	Observing geostationary satellites	425
24.5	Solar disc phenomena: practical exercises	428
24.5.1	Visual observations	428
24.5.2	Recording sunspots by drawing	428
24.5.3	Determination of the solar rotation period	429
24.5.4	The eccentricity of the Earth's orbit	432
24.5.5	Use of a pinhole camera	432
24.5.6	Atmospheric extinction	432
24.6	The Moon's orbit: practical projects	434
24.6.1	Measuring the Moon's distance	437
24.7	Planetary orbits	440
24.7.1	The outer planets	440
24.7.2	The inner planets	442
24.7.3	Kepler's second law	442
24.8	The telescope	443
24.8.1	Resolving power	444
24.8.2	Magnifying power	444
24.9	Photography of star fields	445
24.10	Spectra	445
24.11	Michelson's stellar interferometer	448
24.12	Digital photography	449
Web sites		451
Appendix: Astronomical and related constants		454
A.1	Physical constants	454
A.2	Time	454
A.3	Mathematical constants, systems of units and conversion factors	455
A.4	Basic formulas	456
Bibliography		458
1	Source books	458
2	Practical projects	458
3	Books on specific topics	459
Answers to problems		460
Index		469
