Preface	x
1 Introduction	1
1.1 Understanding equations	1
1.2 Solving equations	1
1.3 Checking solutions	3
2 Theory of seismic waves	7
2.1 The basic elastic constants	7
2.2 Interrelationships among elastic constants	9
2.3 Magnitude of disturbance from a seismic source	14
2.4 Magnitudes of elastic constants	15
2.5 General solutions of the wave equation	18
2.6 Wave equation in cylindrical and spherical coordinates	20
2.7 Sum of waves of different frequencies; Group velocity	24
2.8 Magnitudes of seismic wave parameters	26
2.9 Potential functions used to solve wave equations	27
2.10 Boundary conditions at different types of interfaces	29
2.11 Boundary conditions in terms of potential functions	30
2.12 Disturbance produced by a point source	31
2.13 Far- and near-field effects for a point source	32
2.14 Rayleigh-wave relationships	33
2.15 Directional geophone responses to different waves	38
2.16 Tube-wave relationships	38
2.17 Relation between nepers and decibels	40
2.18 Attenuation calculations	41
2.19 Diffraction from a half-plane	42
3 Partitioning at an interface	47
3.1 General form of Snell's law	47
3.2 Reflection/refraction at a solid/solid interface; Displacement of a free surface	49

3.3	Reflection/refraction at a liquid/solid interface	53
3.4	Zoeppritz's equations for incident SV- and SH-waves	58
3.5	Reinforcement depth in marine recording	60
3.6	Complex coefficient of reflection	61
3.7	Reflection and transmission coefficients	62
3.8	Amplitude/energy of reflections and multiples	65
3.9	Reflection/transmission coefficients at small angles	70
3.10	Magnitude of $\Delta\sigma/\sigma$ relative to $\Delta\alpha/\alpha$ and $\Delta\beta/\beta$	72
3.11	AVO versus AVA and effect of velocity gradient	73
3.12	Variation of reflectivity with angle (AVA)	74
4	Geometry of seismic waves	79
4.1	Accuracy of normal-moveout calculations	79
4.2	Dip, cross-dip, and angle of approach	82
4.3	$X^2-T^2$ relationship for a dipping bed	88
4.4	Reflector dip in terms of traveltimes squared	89
4.5	Second approximation for dip moveout	91
4.6	Calculation of reflector depths and dips	91
4.7	Plotting raypaths for primary and multiple reflections	92
4.8	Effect of migration on plotted reflector locations	94
4.9	Resolution of cross-dip	97
4.10	Cross-dip	98
4.11	Variation of reflection point with offset	101
4.12	Functional fits for velocity-depth data	103
4.13	Relation between average and rms velocities	105
4.14	Vertical depth calculations using velocity functions	108
4.15	Depth and dip calculations using velocity functions	109
4.16	Weathering corrections and dip/depth calculations	111
4.17	Using a velocity function linear with depth	114
4.18	Head waves (refractions); Effect of hidden layer	117
4.19	Interpretation of sonobuoy data	121
4.20	Diving waves	125
4.21	Linear increase in velocity above a refractor	128
4.22	Time-distance curves for various situations	130
4.23	Locating the bottom of a borehole	133
4.24	Two-layer refraction problem	135
5	Seismic velocity	141
5.1	Maximum porosity versus depth	141
5.2	Relation between lithology and seismic velocities	142
5.3	Porosities, velocities, and densities of rocks	143
5.4	Velocities in limestone and sandstone	146

5.5	Dependence of velocity-depth curves on geology	148
5.6	Effect of burial history on velocity	149
5.7	Determining lithology from well-velocity surveys	151
5.8	Reflectivity versus water saturation	151
5.9	Effect of overpressure	153
5.10	Effects of weathered layer (LVL) and permafrost	153
5.11	Horizontal component of head waves	155
5.12	Stacking velocity versus rms and average velocities	156
5.13	“Quick-look” velocity analysis; Effects of errors	160
5.14	Well-velocity survey	163
5.15	Interval velocities from $X^2-T^2$ analyses	167
5.16	Finding velocity by the $X^2-T^2$ method	168
5.17	Effect of timing errors on stacking velocity, depth, and dip	170
5.18	Estimating lithology from stacking velocity	173
5.19	Velocity versus depth from sonobuoy data	175
5.20	Influence of direction on velocity analyses	179
5.21	Effect of time picks, NMO stretch, and datum choice on stacking velocity	179
6	Characteristics of seismic events	181
6.1	Characteristics of different types of events and noise	181
6.2	Horizontal resolution	183
6.3	Reflection and refraction laws and Fermat’s principle	184
6.4	Effect of reflector curvature on a plane wave	185
6.5	Diffraction traveltime curves	187
6.6	Amplitude variation with offset for seafloor multiples	188
6.7	Ghost amplitude and energy	189
6.8	Directivity of a source plus its ghost	191
6.9	Directivity of a harmonic source plus ghost	192
6.10	Differential moveout between primary and multiple	194
6.11	Suppressing multiples by NMO differences	196
6.12	Distinguishing horizontal/vertical discontinuities	197
6.13	Identification of events	198
6.14	Traveltime curves for various events	199
6.15	Reflections/diffractions from refractor terminations	201
6.16	Refractions and refraction multiples	207
6.17	Destructive and constructive interference for a wedge	211
6.18	Dependence of resolvable limit on frequency	211
6.19	Vertical resolution	214
6.20	Causes of high-frequency losses	215
6.21	Ricker wavelet relations	216
6.22	Improvement of signal/noise ratio by stacking	218

7	Seismic equipment	221
7.1	Radiolocation errors because of velocity variations	221
7.2	Effect of station angle on location errors	222
7.3	Transit satellite navigation	223
7.4	Effective penetration of profiler sources	224
7.5	Directivity of linear sources	226
7.6	Sosie method	230
7.7	Energy from an air-gun array	239
7.8	Dominant frequencies of marine sources	239
7.9	Effect of coil inductance on geophone equation	241
7.10	Streamer feathering due to cross-currents	242
7.11	Filtering effect of geophones and amplifiers	246
7.12	Filter effects on waveshape	249
7.13	Effect of filtering on event picking	251
7.14	Binary numbers	251
8	Reflection field methods	253
8.1	Effect of too many groups connected to the cable	253
8.2	Reflection-point smear for dipping reflectors	254
8.3	Stacking charts	254
8.4	Attenuation of air waves	258
8.5	Maximum array length for given apparent velocity	258
8.6	Response of a linear array	259
8.7	Directivities of linear arrays and linear sources	262
8.8	Tapered arrays	263
8.9	Directivity of marine arrays	264
8.10	Response of a triangular array	264
8.11	Noise tests	266
8.12	Selecting optimum field methods	267
8.13	Optimizing field layouts	268
8.14	Determining vibroseis parameters	271
8.15	Selecting survey parameters	273
8.16	Effect of signal/noise ratio on event picking	274
8.17	Interpreting uphole surveys	279
8.18	Weathering and elevation (near-surface) corrections	281
8.19	Determining static corrections from first breaks	284
8.20	Determining reflector location	289
8.21	Blondeau weathering corrections	292
9	Data processing	295
9.1	Fourier series	295
9.2	Space-domain convolution; Vibroseis acquisition	298
9.3	Fourier transforms of the unit impulse and boxcar	299

9.4	Extension of the sampling theorem	302
9.5	Alias filters	305
9.6	The convolutional model	307
9.7	Water reverberation filter	307
9.8	Calculating crosscorrelation and autocorrelation	310
9.9	Digital calculations	312
9.10	Semblance	313
9.11	Convolution and correlation calculations	313
9.12	Properties of minimum-phase wavelets	316
9.13	Phase of composite wavelets	318
9.14	Tuning and waveshape	320
9.15	Making a wavelet minimum-phase	329
9.16	Zero-phase filtering of a minimum-phase wavelet	329
9.17	Deconvolution methods	330
9.18	Calculation of inverse filters	333
9.19	Inverse filter to remove ghosting; Recursive filtering	334
9.20	Ghosting as a notch filter	336
9.21	Autocorrelation	337
9.22	Wiener (least-squares) inverse filters	338
9.23	Interpreting stacking velocity	345
9.24	Effect of local high-velocity body	347
9.25	Apparent-velocity ( $f$ - $k$ ) filtering	349
9.26	Complex-trace analysis	351
9.27	Kirchhoff migration	355
9.28	Using an upward-traveling coordinate system	357
9.29	Finite-difference migration	358
9.30	Effect of migration on fault interpretation	360
9.31	Derivative and integral operators	360
9.32	Effects of normal-moveout (NMO) removal	362
9.33	Weighted least-squares	363
10	Geologic interpretation of reflection data	367
10.1	Improvement due to amplitude preservation	367
10.2	Deducing fault geometry from well data	368
10.3	Structural style	371
10.4	Faulting	374
10.5	Mapping faults using a grid of lines	376
10.6	Fault and stratigraphic interpretation	381
10.7	Interpretation of salt uplift	385
10.8	Determining the nature of flow structures	387
10.9	Mapping irregularly spaced data	389
10.10	Evidences of thickening and thinning	389
10.11	Recognition of a reef	394

10.12	Seismic sequence boundaries	396
10.13	Unconformities	401
10.14	Effect of horizontal velocity gradient	403
10.15	Stratigraphic interpretation	404
10.16	Interpretation of a depth-migrated section	405
10.17	Hydrocarbon indicators	408
10.18	Waveshapes as hydrocarbon accumulation thickeners	410
11	Refraction methods	415
11.1	Salt lead time as a function of depth	415
11.2	Effect of assumptions on refraction interpretation	416
11.3	Effect of a hidden layer	417
11.4	Proof of the ABC refraction equation	420
11.5	Adachi's method	421
11.6	Refraction interpretation by stripping	424
11.7	Proof of a generalized reciprocal method relation	428
11.8	Delay time	430
11.9	Barry's delay-time refraction interpretation method	431
11.10	Parallelism of half-intercept and delay-time curves	435
11.11	Wyrobek's refraction interpretation method	435
11.12	Properties of a coincident-time curve	441
11.13	Interpretation by the plus-minus method	443
11.14	Comparison of refraction interpretation methods	446
11.15	Feasibility of mapping a horizon using head waves	459
11.16	Refraction blind spot	460
11.17	Interpreting marine refraction data	461
12	3D methods	469
12.1	Spatial sampling restrictions	469
12.2	Bin size in marine work	470
12.3	Effect of crosscurrents	472
12.4	Number of seismic sources	473
12.5	Circle shooting	474
12.6	Ocean-bottom cable surveys	474
12.7	Vibroseis land survey	477
12.8	Loop layout for a 3D survey	480
12.9	Fault interpretation using time slices	482
12.10	Acquisition direction for marine 3D surveys	484
13	Specialized techniques	485
13.1	S-wave conversion in marine surveys	485
13.2	Equally inclined orthogonal geophones	486

13.3	Guided (Channel) waves; Normal-mode propagation	487
13.4	Vertical seismic profiling	489
13.5	Effect of velocity change on VSP traveltime	492
13.6	Mapping the vertical flank of a salt dome	493
13.7	Poission's ratio from P- and S-wave traveltimes	495
14	Specialized applications	497
14.1	Using refraction method to find depth to bedrock	497
14.2	Interpreting engineering refraction profiles	498
14.3	Interpretation of four-shot refraction data	501
	References	505
