Preface	
Notation for function spaces	
O. Introduction	1
I. Continuum mechanics for viscoelastic materials	
1. Kinematics and balance laws	11
2. General principles for constitutive laws	15
3. Constitutive models for viscoelastic materials	20
4. One-dimensional problems	24
II. Hyperbolicity and wave propagation	
1. Introduction	28
2. Characteristics and change of type	30
3. Linear wave propagation	38
4. Development of singularities	56
5. Shock conditions, instantaneous elasticity, and hypoelasticity	73
6. Steady shock and acceleration waves in one dimension	76
III. Local existence results based on energy methods	
1. Energy methods	81
2. Review of the elastic case	82
3. Viscoelastic materials of integral type	87
4. Incompressible nonlinear elasticity	101
5. A model problem with a singular memory function	118
IV. Global existence results	
1. Introduction	134
2. Global existence for a parabolic problem	135
3. The damped wave equation	139
4. Viscoelastic materials of integral type	148
5. Three-dimensional motions of a K-BKZ fluid	171
6. A global existence result for large data	184
V. Applications of methods of semigroup theory	
1. Review of linear evolution problems	194
2. Time-dependent coefficients and nonlinear problems	200
3. Various alternatives for treating memory terms	208
4. Linear viscoelasticity	212
5. A parabolic problem	217
6. A hyperbolic problem	222
7. Three-dimensional motions of Jeffreys-type materials	229
8. Three-dimensional motions of a K-BKZ fluid	237

VI. Steady flows of viscoelastic fluids	
1. Introduction	244
2. Slow steady flows of a Maxwell fluid	246
3. Problems with inflow boundaries	249
4. The case of several relaxation modes	254
References	256
