1	Introduction	1
I	Hamiltonian and Lagrangian theory	7
2	Notations and basic facts on center manifolds	9
3	The linear theory	17
3.1	Spectral projections	18
3.2	Linear normal forms	20
4	Hamiltonian flows on center manifolds	27
4.1	Reduction in the symplectic case	28
4.2	Reduction of Poisson structures	31
4.3	Flattening of center manifolds	34
5	Hamiltonian systems with symmetries	41
5.1	Lie groups	41
5.2	Factorization by symmetry	44
5.3	Canonical Hamiltonian systems	49
5.4	Darboux's theorem in the presence of symmetry	51
5.5	Reversible systems	57
6	Lagrangian systems	61
6.1	Lyapunov-Schmidt and projection method	62
6.2	The abstract setting of Lagrangian systems	65
6.3	Linear theory	66
6.4	Nonlinear systems	72
6.5	Natural reduction	72
6.6	Symmetric Lagrangian systems	75
6.7	Center manifolds for relative equilibria	77

7	Nonautonomous systems	85
7.1	First considerations	85
7.2	The extended system and Darboux's theorem	86
7.3	Piecewise autonomous systems	89
7.4	A four-dimensional example	90
II	Applications to variational problems	93
8	Elliptic variational problems on cylindrical domains	95
8.1	Second order elliptic systems	96
8.2	A first example	99
8.3	A nonautonomous example	101
9	Capillarity surface waves	103
9.1	The variational formulation	104
9.2	Small surface tension and λ close to 1	106
9.3	Homoclinic solutions	107
10	Necking of strips	109
10.1	The physical equations	109
10.2	Strong ellipticity	111
10.3	The dynamical formulation	113
10.4	The reduced Hamiltonian problem	116
11	Saint-Venant's problem	121
11.1	The physical equations	122
11.2	Symmetry under rigid-body transformations	123
11.3	The reduced Lagrangian system	125
11.4	On natural reduction	127
11.5	Reduction via symmetry	129
11.6	Cross-sectional symmetries and reversibility	130
