Optimization Theory for Large Systems

LEON S. LASDON · CASE WESTERN RESERVE UNIVERSITY

THE MACMILLAN COMPANY

COLLIER-MACMILLAN LIMITED, LONDON

Contents

1. Linear and Nonlinear Programming 1

1.1 Unconstrained Minimization *1*

1.2 Linear Programming *20*

1.2.1 Simplex Method *20*
1.2.2 Revised Simplex Method *40*
1.2.3 Duality in Linear Programming *46*
1.2.4 Dual Simplex and Primal–Dual Algorithms *52*

1.3 Nonlinear Programming *64*

1.3.1 Convexity *68*
1.3.2 Kuhn–Tucker Conditions *73*
1.3.3 Saddle Points and Sufficiency Conditions *83*
1.3.4 Methods of Nonlinear Programming *91*

REFERENCES *102*

2. Large Mathematical Programs with Special Structure 104

2.1 Introduction *104*
2.2 Activity Analysis *106*
2.3 Production and Inventory Problem *109*
2.4 Dynamic Leontief Model *110*
2.5 Angular and Dual-Angular Structures *117*
2.6 Linear Programs with Many Rows or Columns *122*

2.7 Nonlinear Programs with Coupling Variables *130*
2.8 Mixed-Variable Programs and a Location Problem *135*

PROBLEMS *142*

REFERENCES *143*

3. The Dantzig–Wolfe Decomposition Principle 144

3.1 Introduction *144*
3.2 A Theorem on Convex Combinations *145*
3.3 Column Generation *146*
3.4 Development of the Decomposition Principle *148*
3.5 Example of the Decomposition Principle *155*
3.6 Economic Interpretation of the Decomposition Principle *160*
3.7 Lower Bound for the Minimal Cost *163*
3.8 Application to Transportation Problems *165*
3.9 Generalized Transportation Problems and a Forestry-Cutting Example *168*
3.10 Optimal Allocation of Limited Resources *171*
3.10.1 General Formulation *171*
3.10.2 Specializing the Model—Lot Sizes and Labor Allocations *117*
3.10.3 Computational Experience *181*
3.11 Primal–Dual Approach to the Master Program *185*
3.11.1 Linear Fractional Programming *185*
3.11.2 Application of the Primal–Dual Method to the Master Program *193*
3.11.3 Example of the Primal–Dual Method *197*
3.12 Three Algorithms for Solving the Master Program—A Comparison *201*

PROBLEMS *203*

REFERENCES *205*

4. Solution of Linear Programs with Many Columns by Column-Generation Procedures 207

4.1 The Cutting-Stock Problem *207*
4.2 Column-Generation and Multi-item Scheduling *217*
4.3 Generalized Linear Programming *230*
4.4 Grid Linearization and Nonlinear Programming *242*
4.4.1 General Development *242*

4.4.2 Nonlinear Version of the Dantzig–Wolfe Decomposition Principle *252*
4.5 Design of Multiterminal Flow Networks *254*

PROBLEMS *263*

REFERENCES *265*

5. Partitioning and Relaxation Procedures in Linear Programming 267

5.1 Introduction *267*
5.2 Relaxation *268*
5.3 Problems with Coupling Constraints and Coupling Variables *276*
5.4 Rosen's Partitioning Procedure for Angular and Dual-Angular Problems *284*
5.4.1 Development of the Algorithm *284*
5.4.2 Computational Considerations *291*
5.4.3 Computational Experience *296*
5.4.4 Example of Rosen's Partitioning Method *298*

PROBLEMS *302*

REFERENCES *303*

6. Compact Inverse Methods 304

6.1 Introduction *304*
6.2 Revised Simplex Method with Inverse in Product Form *304*
6.3 Upper Bounding Methods *319*
6.4 Generalized Upper Bounding *324*
6.4.1 Development of the Algorithm *324*
6.4.2 Example of the Generalized Upper Bounding Method *334*
6.5 Extension to Angular Structures *340*

PROBLEMS *356*

REFERENCES *356*

7. Partitioning Procedures in Nonlinear Programming 358

7.1 Introduction *358*
7.2 Rosen's Partitioning Algorithm for Nonlinear Programs *359*

7.2.1 Development of the Algorithm *360*
7.2.2 Use of Partition Programming in Refinery Optimization *369*
7.3 Benders' Partitioning Algorithm for Mixed-Variable Programming Problems *370*
7.3.1 Development of the Algorithm *370*
7.3.2 Relation to the Decomposition Principle and Cutting-Plane Algorithms *381*
7.3.3 Application to a Warehouse Location Problem *385*
7.3.4 Numerical Example *388*
7.3.5 Computational Experience *389*

PROBLEMS *392*

REFERENCES *394*

8. Duality and Decomposition in Mathematical Programming 396

8.1 Introduction *396*
8.2 Decomposition Using a Pricing Mechanism *397*
8.3 Saddle Points of Lagrangian Functions *399*
8.3.1 Basic Theorems *399*
8.3.2 Everetts Theorem *402*
8.3.3 Application to Linear Integer Programs *404*
8.4 Minimax Dual Problem *406*
8.5 Differentiability of the Dual Objective Function *419*
8.6 Computational Methods for Solving the Dual *428*
8.7 Special Results for Convex Problems *435*
8.8 Applications *440*
8.8.1 Problems Involving Coupled Subsystems *440*
8.8.2 Example—Optimal Control of Discrete-Time Dynamic Systems *446*
8.8.3 Problems in Which the Constraint Set is Finite: Multi-item Scheduling Problems *449*

PROBLEMS *456*

REFERENCES *458*

9. Decomposition By Right-Hand-Side Allocation 460

9.1 Introduction *460*
9.2 Problem Formulation *460*
9.3 Feasible-Directions Algorithm for the Master Program *464*

9.4 Alternative Approach to the Direction-Finding Problem *475*
9.5 Tangential Approximation *482*

PROBLEMS *491*

REFERENCES *491*

Appendix 1. Convex Functions and Their Conjugates *493*

Appendix 2. Subgradients and Directional Derivatives of Convex Functions *502*

REFERENCES *513*
