## Preface, xi

### 1 Introduction, 1

- 1.1 Preliminary remarks, 1
- 1.2 A brief history, 3
- 1.3 Overview, 7
- 1.4 Importance of **unimolecular** and **recombination** processes, 11

### 2 Elementary Treatment of Unimolecular Reactions, 15

- 2.1 Overview, 15
- 2.2 The Lindemann-Hinshelwood mechanism and its generalization, 16
  - Separation of reaction and collision steps, 16
  - High-pressure limit, 19
  - Densities of states, 20
- 2.3 Quantum mechanics, classical mechanics and statistical mechanics, 22
  - Potential surfaces, 22
  - Classical equations of motion, 24
  - Phase space and classical trajectories, 25
  - The partition function and equilibrium **distributions**, 26
- 2.4 Transition state theory, 27
  - The reaction coordinate, 27
  - Equations of motion in reaction coordinates, 30
  - Derivation of transition state expression, 33
  - Sample **evaluation** of the **high-pressure** rate coefficient, 39
- 2.5 **High-pressure activation** energy and frequency factor, 41
  - Thermodynamics** of the transition state, 42
  - Characteristic **activated** complexes and A-factors, 45
- 2.6 **High-pressure recombination** rate coefficients, 48
  - Exercises, 49
  - Selected answers, 50

### 3 Microscopic Rate Coefficients, 52

- 3.1 Overview, 52
- 3.2 Microscopic rate coefficients - **introduction**, 53
  - The RRKM result, 53
- 3.3 The exact **time-dependent microscopic** rate coefficient, **56**
- 3.4 The **ergodicity assumption**, **59**
- 3.5 Derivation of the RRKM result for  $k(E)$ , 64
  - The transition state **assumption**, **64**
  - The **high-pressure** limit, **68**
- 3.6 Active and inactive degrees of freedom, 70
- 3.7 **Angular momentum conservation** - the basic effect, 71
  - Approximate angular momentum conservation**, **74**
- 3.8 **Derivation of the RRKM result for  $k(E, J)$** , 78
  - $k(E, J)$  for reactions with a chemical barrier, 80

- $k(E,J)$  for reactions without a chemical barrier, 82
  - The quantum expression for  $k(E,J)$ , 83
  - The high-pressure limit, 84
- 3.9 Symmetry numbers, optical isomerism and reaction path degeneracy, 87
  - Torsional rotations, 95
  - Symmetry numbers in loose transition states, 96
  - Summary, 98
- 3.10 **Variational** selection of the transition state, 98
  - The reaction coordinate, 99
  - Microcanonical **variational** transition state theory, 99
  - Canonical **variational** transition state theory, 105
- 3.11 Microscopic reversibility - forward and reverse rate coefficients, 107
- 3.12 Alternative statistical models, 109
  - The statistical adiabatic channel model, 110
  - Phase space theory, 114
- 3.13 Tests of statistical theories, 114
  - Comparison with experiment, 115
  - Comparison with exact calculations, 119
  - Comparison with capture models for ion-molecule reactions, 121
- 3.14 Non-adiabatic reactions, 123
- 3.15 Summary, 129
  - Exercises, 129
  - Selected answers, 132

## 4 Implementations of Statistical Theories, 136

- 4.1 Outline, 136
- 4.2 The simplified **Hamiltonian - separable** degrees of freedom, 137
- 4.3 Computing the density of states, 139
  - Proof of convolution formula, 139**
  - Convolution of rotational** densities of states, 141
  - Convolution of vibrational** densities of states - the **Beyer-Swinehart** algorithm, 149
  - Convolution** of the densities of states of rotations with vibrations, 157
- 4.4 Finding RRKM parameters for the reactant, 158
  - Normal **mode analysis**, 159
  - Parameters for rotations, 164
- 4.5 Transition states at a chemical barrier, 165
  - Ab initio* transition state parameters, 166
  - Semi-empirical RRKM parameters for tight transition states - Benson's rules, 167
  - Determination of critical energies, 171
- 4.6 Transition states for reactions without a chemical barrier, 173
  - A simple **model** for the **loose transition** state, 174
  - Treatment of fragment **rotations in the loose transition** state, 175
  - Variational implementation of RRKM theory for loose transition states**, 179
  - Sensitivity of the rate coefficient to the **interaction potential**, 180
- 4.7 **Multichannel** reactions, 183
- 4.8 Case studies 1 - **reactions** with chemical barriers, 183
  - Decomposition** of the ethyl **radical** - using *ab initio* calculations, 183
  - Decomposition of chloroethane - application of Benson's rules**, 187
  - Benson's rules and the decomposition of 1-chloropropane**, 190
- 4.9 Case studies 2 - barrierless reactions, 192
  - Recombination** of methyl radicals, 192

An ion-molecule association-  $\text{CH}_3^+ + \text{HCN}$ , 198

4.10 Practical SACM calculations, 201

4.11 Summary, 208

Exercises, 209

Selected answers, 210

## 5 Collisional Energy Transfer, 212

5.1 Overview, 212

5.2 Energy transfer rate - **qualitative** considerations, 213

5.3 Dependence of falloff curves on energy transfer rate coefficient, 218

Moments of energy transfer rate coefficient **distribution** function, 218

5.4 **Calculation** of energy transfer rate from classical trajectories, 222

5.5 Models for the collision frequency, 228

Classical elastic scattering, 231

Collision integrals, 234

5.6 Approximate models for the energy transferred per collision, 237

Exponential-down model, 239

Biased random walk model, 239

Strong collision model, 246

Ergodic models, 247

**Summary**, 248

5.7 Experimental determinations of energy transfer parameters, 249

Indirect methods, 249

Direct methods, 251

5.8 Experimental data on collisional energy transfer - results, 254

**Qualitative** trends in collisional energy transfer data, 256

5.9 Transfer of rotational energy in collisions, 257

**Quantitative** form of rotational energy transfer rate - rotational energy dependence, 259

5.10 Quantum effects, 262

5.11 Summary, 263

Exercises, 264

Selected answers, 266

## 6 The Master equation, 268

6.1 Overview, 268

6.2 **Continuum and discrete** forms of the master **equation**, 269

6.3 The **unimolecular** rate coefficient as the largest **eigenvalue**, 271

6.4 High- and low-pressure limits, 275

**High-pressure** limit, 276

**Low-pressure** limit, 278

6.5 Numerical solution of the master equation, 280

**Normalization**, 281

**Solution of eigenvalue problem**, 282

6.6 **Qualitative behaviour** of falloff curves, 285

6.7 **Approximate analytical solutions**, 289

**Strong collision model**, 289

**Collision broadening** factors, 293

**Solution of master equation for double-exponential model**, 296

6.8 **Recombination, chemical activation and reversible isomerization** systems, 299

**Recombination**, 304

**Chemical activation**, 305

Reversible isomerization, 305

**6.9 Multi-photon** dissociation, 307

6.10 Solution of master **equation** with **angular** momentum conservation, 312

'Initial J independent' solution, 313

Weak collisions in J, 316

6.11 Case studies, 318

Preliminaries, 318

Fitting data, 320

**Extrapolating data**, 322

Predicting data, 327

6.12 **Summary**, 329

Exercises, 329

Selected answers, 331

7 **Conclusion**, 333

**Appendices, 334**

A. Classical **transformations of coordinates**, 334

B. The Langevin limit, 339

**Bibliography**, 341

**Index**, 351
