

Fundamentals of ferrous low-carbon lath martensite:
from the as-quenched, to tempered and
deformed states

Von der Fakultät für Georessourcen und Materialtechnik der
Rheinisch-Westfälischen Technischen Hochschule Aachen

zur Erlangung des akademischen Grades eines
Doktors der Naturwissenschaften

genehmigte Dissertation
vorgelegt von **M.Sc.**

Lutz Morsdorf

aus Recklinghausen

Berichter: Professor Dr.-Ing. Dierk Raabe
Univ.-Prof. Dr. Sandra Korte-Kerzel

Tag der mündlichen Prüfung: 27. Juni 2017

Contents

1	Introduction.....	1
2	Materials.....	5
3	Experimental.....	7
4	Chapter A: As-quenched.....	19
4.1	Methodology: 3D microstructure characterization.....	25
4.2	Lath size distribution.....	27
4.3	Defect structures.....	33
4.4	Autotempering.....	35
4.5	Local plasticity.....	40
4.6	Summary.....	42
5	Chapter B: Tempered.....	45
5.1	Methodology: Quasi-in-situ tracking of tempering reactions.....	49
5.2	Evolution of defect structures.....	55
5.3	Evolution of local chemistry.....	60
5.4	Carbon redistribution mechanism.....	72
5.5	Grain boundary precipitation.....	81
5.6	Evolution of local plasticity.....	91
5.7	Summary.....	94
6	Chapter C: Deformed.....	95
6.1	Methodology: Multi-scale strain mapping and topography analysis.....	98
6.2	Strain localization.....	100
6.3	Bulk plasticity.....	103
6.4	Interface plasticity.....	106
6.5	Plasticity influenced by microstructure heterogeneities.....	114
6.6	Summary.....	116
7	Key findings in brief.....	119
8	Concluding remarks and outlook.....	121
9	Bibliography.....	127
