Contents

<i>Preface</i>	xi
1. Lecture 1. Yang-Mills Theory	1
1.1 Construction of non-Abelian gauge theories	3
1.2 Fermion (quark) matter	8
1.3 Yukawa couplings	9
Appendix 1.1: C. N. Yang and Robert Mills	9
2. Lecture 2. Yang-Mills Theories (<i>Continued</i>)	13
2.1 Vertices in Yang-Mills with quarks	13
2.2 Higgsing	14
2.3 From Minkowski to Euclidean formulation	17
Appendix 2.1	20
3. Lecture 3. Path Integral Quantization	23
3.1 Path Integral	23
3.1.1 What is path integral	23
3.1.2 Quantum-mechanical example: Harmonic oscillator	25
3.2 Path integral quantization	27
3.3 Harmonic oscillator: Green's function	29
Appendix 3.1: On Richard Feynman	32
4. Lecture 4. Path Integral in Scalar QFT	33
4.1 Free scalar field theory	33
4.2 Calculation of the partition function	33

4.3	General remark on n -point functions	35
4.4	Calculation of the scalar propagator	37
5.	Lecture 5. Complex Scalar Field and Finite Temperature	39
5.1	Scalar field (<i>continued</i>)	39
5.2	QFT at finite temperature	42
6.	Lecture 6. Calculus of Grassmann Numbers and Spinor Fields	45
6.1	Grassmann numbers	45
6.2	Calculus on Grassmann numbers	46
6.3	Generalization to complex Grassmann numbers	47
6.4	Exponential integrand	48
6.5	Four-dimensional spinors	48
6.5.1	Two and three dimensions	54
	Appendix 6.1. On Ettore Majorana	56
	Appendix 6.2: Derivation of (6.34) from (6.31)	57
	Appendix 6.3: On Hermann Grassmann and Felix Berezin	57
7.	Lecture 7. Fermion Fields in Path Integrals	61
7.1	Dirac fields in path integrals	61
7.2	Fermions at finite temperature	64
8.	Lecture 8. Gauge Fields in Path Integral: The Simplest Example of QED	71
8.1	Photon fields in path integral	71
	Appendix 8.1: On L. D. Faddeev	77
9.	Lecture 9. Non-Abelian Gauge Fields in Path Integrals	79
	Appendix 9.1: Properties of group generators and the Casimir coefficients	83
10.	Lecture 10. How to Calculate Charge Renormalization	85
10.1	Scalar field	87
10.2	Pauli–Villars regularization	90
10.3	Calculation of the scalar field loop	92
10.4	Calculation of the fermion loop	94
	Appendix 10.1. A Very Useful Appendix	96

11. Lecture 11. Yang-Mills Coupling (<i>Continued</i>)	101
11.1 The scalar and fermion field loops	101
11.2 The gauge field and ghost loops	103
Appendix 11.1: On Julian Schwinger and the background field method in QCD	108
12. Lecture 12. What if Vacuum is Not Unique	109
12.1 Degenerate vacua: Path integral	109
12.2 Path-integral quantization in the Higgsed regime	111
12.2.1 Abelian Higgsed theory	111
12.3 Non-Abelian case	115
13. Lecture 13. Condensed Matter Week	119
13.1 General	119
13.2 The (classical) Heisenberg model	119
13.3 The Ising model	123
13.4 The Ising model at the critical point	128
13.5 Solution	133
Appendix 13.1: On Ernest Ising	137
14. Lecture 14. Renormalization Group; RG Flow	141
14.1 Charge renormalization (<i>continued</i>)	141
14.2 Running couplings, renormalization group	142
14.3 Running gauge coupling. Beta function for Yang-Mills theory with matter	143
14.3.1 Asymptotic freedom in Yang-Mills theories	144
14.4 QED, the Landau pole	146
14.5 Zeros of the β functions. Conformal points	146
Appendix 14.1: Screening versus antiscreening	149
15. Lecture 15. Phases of Yang-Mills Theories	155
15.1 Confinement	156
15.2 Adding massless quarks	158
15.3 Conformal phase	159
15.4 Chiral symmetry breaking	162
15.5 A few words on other regimes	165

16.	Lecture 16. Anomalous Dimensions. Quark Mass in QCD	169
16.1	Anomalous dimension	169
16.2	More on dimensional transmutation	173
16.2.1	A few words on scale transformation	175
17.	Lecture 17. More on χ SB. Effective Lagrangians	177
17.1	Spontaneous breaking of chiral symmetry	177
17.2	Effective Lagrangians	179
17.2.1	Baryons. The Skyrme model	180
17.3	χ SB versus color and flavor	183
17.4	The number of Goldstone particles (gapless excitations)	185
	Appendix 17.1: On Maurice Lévy and Tony Skyrme	186
18.	Lecture 18. Quantum Anomalies	189
18.1	Anomalies in QCD and similar non-Abelian gauge theories	190
18.2	Chiral anomaly in the singlet axial current	191
18.2.1	The Pauli–Villars regularization	192
18.2.2	The Schwinger regularization	194
18.3	The chiral anomaly for generic fermions	195
18.4	Wilson line and Wilson loop	196
19.	Lecture 19. Quantum Anomalies (<i>Continued</i>)	199
19.1	Cancellation of internal anomalies in Standard Model (SM)	199
19.2	Internal anomalies in SM. First generation	199
19.3	Peculiarity of the $SU(2)$ sector	203
19.4	Witten’s global anomaly in $SU(2)$	203
19.5	Other anomalies	204
	Appendix 19.1: Creators of the Standard Model	205
20.	Lecture 20. “External” Anomalies: Implications	209
20.1	“External” anomalies	209
20.2	Longitudinal part of the current	210
20.3	’t Hooft matching and its physical implications	211
20.4	Spontaneous breaking of the axial symmetry	213
20.5	Predicting the $\pi^0 \rightarrow 2\gamma$ decay rate	214
	Appendix 20.1: Gerard ’t Hooft	215

21. Lecture 21. Divergence of Perturbation Theory at High Orders	217
21.1 Dyson argument and factorial divergences?	217
21.2 Asymptotic series and factorial divergences	218
21.3 Borel summability	220
21.4 How can one determine the rate of factorial divergence	221
21.4.1 The simplest quantum-mechanical example: Anharmonic oscillator	221
21.4.2 Tunneling	223
21.4.3 Bounces	224
Appendix 21.1: On Freeman Dyson	226
22. Lecture 22. Degenerate (Pre)Vacua and Instantons in QM	229
22.1 A brief review of a well-known QM problem	229
22.2 Instantons in QM	232
22.3 Topological charge	236
22.4 Instanton gas	236
Appendix A Lecture 23. Nontrivial Topology in the Space of Fields	239
Appendix B Problems	249
Appendix C Brief History of QFT	275
<i>Index</i>	299
