<i>Preface</i>	iii
<i>Acknowledgments</i>	v
<i>Glossary</i>	xvii

Part I: Fundamentals of Classical Thermodynamics

1. Some Recallings of Physics	3
1. An approach to a perfect gas	3
2. Elastic collisions	4
3. Kinetic theory of perfect gases—A molecular view of pressure	4
4. The kinetic theory of heat and of temperature	7
5. Temperature measurement	7
6. Work	9
2. Some Definitions of Thermodynamics	12
1. Thermodynamic systems	12
2. Thermodynamic state of a system	12
3. Extensive and intensive properties	13
4. Transformation	13
5. Thermodynamic equilibrium	13
6. Reservoir	13
7. Reversible and irreversible processes—Quasi-static processes	13
8. Isothermal process	14
9. Monothermal process	14
10. Isobaric process	14
11. Isochoric process	14
12. Adiabatic process	14
13. State functions	14
3. Equation of State	15
1. Case of a single substance—The perfect gas law	15
2. The state principle	15
3. Generalization	16

4. The First Law of Thermodynamics	17
1. Heat	17
2. Internal energy and global energy	17
3. The conservation of energy	18
4. The first law of thermodynamics	19
5. Some consequences of the first law	19
5. Mathematical Counterparts of First Law	21
1. Mathematical expression of the first law	21
2. Two exceptions of these statements	22
3. Mathematical handling of the state function “internal energy”	22
4. Cyclic transformations—Other form of the first law	23
6. Enthalpy and Heat Capacity	25
1. Enthalpy	25
2. Heat capacity	28
7. Heats of Reactions—Thermochemistry	31
1. Enthalpy change when only “p-V work” is carried out—Heat of reaction	31
2. Calorimetry	31
3. Standard states and standard reactions in chemical systems	32
4. The biological standard state	33
5. Law of constant heat summation—Hess’ law	33
8. Thermochemistry (Following)—Heats of Reactions and Bond Energies	35
1. Heats of formation	35
2. Calculations of standard enthalpies of reactions from heats of formation	36
3. Heats of combustion	36
4. Heats of hydrogenation	37
5. Heat of phase changes: Latent heats of vaporization, fusion, etc.	37
6. Heat changes of reactions in solutions	37
7. Bond energies	38
8. Other methods of calculation of heats of reactions—Thermochemical groups	40
9. Heat of reaction as a function of temperature—Kirchhoff’s rule	40
9. The First Law and the Ideal Gases	45
1. Ideal gases	45
2. Dependence of the enthalpy of an ideal gas on pressure and volume	46
3. Relationship between C_p and C_v	46
4. Thermodynamic changes in expansion processes	47
10. The Second Law of Thermodynamics	50
1. Entropy and bioenergetics	50
2. Clausius’ statement of the second law	50

3. Carnot's theorem of heat engines	51
4. Other statements of the second law	52
11. The Entropy Function	53
1. Notion of balance-sheet	53
2. Conservative and non-conservative quantities	54
3. Irreversible and reversible processes	54
4. The need of a common quantitative measure of the tendency of systems to evolve in a given direction	54
5. The function entropy	55
6. A second, but equivalent, definition of the function entropy	56
7. The second law of thermodynamics	57
8. Some consequences of the above statement of the second law	57
9. Come back to the notion of reversibility	58
12. Calculations Involving the Function Entropy	61
1. Entropy and internal energy	61
2. General principle of the calculation of the entropy changes of systems	62
3. Entropy changes and partial derivatives involving it	69
4. Expressing the different partial derivatives—Maxwell relations	69
5. Entropy change accompanying a reversible phase transition	72
13. Further Considerations on the Meaning of Function Entropy	73
1. Carnot's cycle	73
2. Heat is a degraded form of energy	75
3. Energies of great and weak entropies	78
4. Come back on the fact that entropy is a thermodynamic property	78
5. Calculation of entropy changes from thermal data	79
6. Questions about the meaning of the quantity entropy	79
7. Some molar entropy values—so-called absolute entropy values S_T°	81
8. A brief summary of the properties of the entropy and of its implications on the second law	82
14. Free Energy, Free Enthalpy—Helmholtz and Gibbs Energies	83
1. Monothermal transformation—Free energy and enthalpy related to the surroundings	83
2. Helmholtz energy	86
3. Gibbs energy function	88
4. Relationships between Helmholtz and Gibbs energies	91
5. Gibbs energy and phase changes	91
6. Exergonic and endergonic reactions	91
15. Open and Closed Systems—Different Expressions of the Composition of a Solution	92
1. Closed and open systems	92
2. Different expressions of the composition of a solution	93

16. Escaping Tendency—Gibbs Energy Change Accompanying a Reaction Between Perfect Gases	95
1. The escaping tendency	95
2. The molar Gibbs energy of a substance as a measure of the escaping tendency	96
3. Change of the molar Gibbs energy of a perfect gas with pressure	96
4. Gibbs energy change accompanying a reaction between perfect gases	97
17. Partial Molar Quantities—Chemical Potential	99
1. The need for new variables for systems of variable compositions	99
2. On the necessity to introduce the partial molar quantities when the species are in solution	100
3. Definition of partial molar quantities	101
4. Physical meaning of the partial molar quantities	102
5. Molar quantities and partial molar quantities	103
6. Fundamental equation of the partial molar quantities	103
7. Thermodynamic relations between partial molar quantities	104
8. Experimental determination of partial molar quantities	104
9. The chemical potential	104
18. Gibbs Energy Change Accompanying a Chemical Reaction—General Equilibrium Condition of a Chemical Reaction	107
1. Gibbs energy change in any process	107
2. Clapeyron equation—Entropy change during a phase transition	108
3. Gibbs energy of a chemical system	109
4. Gibbs-Duhem relation	110
5. Actual molar reactional Gibbs function	110
19. Activity—Ideal Solutions—Standard States	113
1. Definitions of an activity	113
2. A Physico-chemical meaning of an activity	113
3. Some properties of an activity	114
4. Standard states and activities	115
5. Ideal solutions	115
6. Ideal character of a system and interactions between the particles constituting it	116
7. Come back to the activity coefficients	117
8. Standard states and activity coefficients	118
9. Usual conventions for the definitions of the activities	119
10. Osmotic pressure	119
20. The Mass Action Law—Equilibrium Constant of a Chemical Reaction	121
1. Evolving reactions and equilibrium conditions	121
2. Obtaining the mass action law	122

3. Standard reaction Gibbs energy	123
4. Consequences of the arbitrary character of the choice of the standard state	124
5. Formal equilibrium constants—Advantage of the use of activities to express the mass action law	124
6. Differences of values between activities and concentrations	125
7. Come back on the reaction quotient and mass action law	125
8. Calculations of Gibbs energy changes accompanying a chemical reaction	126
9. The Gibbs-Helmholtz equation	126
10. Changes of K and ΔG with temperature	127
21. Gibbs Energy Function Changes: Further Comments	128
1. The Gibbs energy function	128
2. Coupled reactions	129
3. Biological standard states	130
4. Exercises	131
22. Obtention of Standard Reactional Gibbs Energies, Enthalpies and Entropies	132
1. Precise methods	132
2. Approximate methods	137
23. Ligand Binding to Macromolecules	139
1. Definitions	139
2. On the ability of biological macromolecules to interact with various small and large molecules	139
3. Adsorption, another phenomenon for which theories of binding apply	140
4. General equilibrium expression describing the reversible binding of a protein P to a ligand L	140
5. The simplest case of binding	141
6. Achieving experimental data	143
7. A graphical treatment of the preceding case—Scatchard's plot	143
8. Case in which several classes of sites exist	145
9. Cooperative ligand binding—Hill's equation	145
10. The binding of dioxygen to hemoglobin and myoglobin	146
11. Allosterism	147
24. Open Systems—Some Rudiments of Non-Equilibrium Thermodynamics	148
1. Open systems	148
2. A property of enthalpy	149
3. Energy in open systems-exergy	150
4. Useful maximum work, exergy and free enthalpy versus the ambience	150
5. Rate of the exergy decrease and rate of the entropy increase in an irreversible process	151
6. More on open stationary systems	151

7. Difference between equilibrium and stationary (non equilibrium) states	152
8. An example of a stationary open system	152
9. Principles of the study of stationary systems	153
10. Linear thermodynamics of irreversible processes	154
11. Entropy production due to chemical reactions	156
12. General applications in biology	156
25. Some Generalities on the Kinetics of Chemical Reactions	157
1. Some generalities	157
2. Kinetics and equilibria	158
3. Influence of temperature on the rate of chemical reactions: energetic aspects	159
Part II: Some Aspects of Chemical Reactions in Aqueous Solutions	
26. Acid-Base Reactions in Aqueous Solutions	165
1. Definitions of acids and bases and consequences	165
2. Quantitative aspects of acid-base reactions	167
3. Notion of pH	169
4. Distribution diagrams and predominance area	170
5. Buffer solutions	172
6. Macroscopic and microscopic acid-base equilibrium constants	174
7. Prevision of acid-base reactions in aqueous solutions	176
27. Redox Reactions—Redox Couples—Brief Description of an Electrochemical Cell	178
1. Redox equilibria	178
2. Oxidation numbers—A discussion	179
3. Definition of the global reaction of an electrochemical cell	180
4. Description of an electrochemical cell—The galvanic and electrolytic cells	180
5. Some other definitions found in electrochemistry	182
6. Electromotive force of a galvanic cell—Cell potential difference	182
7. Nernst's equation	183
8. Standard reaction entropy change from the temperature coefficient of the emf. of a reversible cell—Determination of the enthalpy change	184
9. Electrode potentials	184
10. Some standard electrode potentials	186
11. Prevision of redox reactions	188
12. Formal potentials	190
28. Other Equilibria in Solutions	191
1. Complexation equilibria	191
2. Partition equilibria between two non-miscible solvents	192
3. The concentration work	193

29. The “Natural Trick” for Bioenergetics to Function	195
1. Displacements of chemical equilibria by coupling reactions	195
2. Inversion of the direction of a reaction	197
3. Coupling of reactions	198

Part III: Thermodynamics of Biological Cells

30. Enzymes—Kinetics of Enzymatic Reactions	203
1. The structure of enzymes	203
2. Classification of enzymes	204
3. Some properties of enzymes	205
4. A diversion on the origin of the L configuration of the amino-acids	206
5. Catalysis	207
6. Kinetics of the catalysis by enzymes—The Michaelis-Menten equation	208
7. Reversible and irreversible inhibitors of enzymes	211
8. Regulatory enzymes—Allosterism of enzymes	211
9. Coenzymes	211
31. The Flow of Energy in the Biological World	212
1. The flow of energy in the biological world	212
2. Sunlight, the ultimate origin of the biological energy	212
3. Photosynthesis	213
4. The great stages (metabolic pathways) of the flow of biological energy	214
5. Respiration	215
6. Biological work	215
7. The flow of matter in the biological world	217
8. Transformation of energy in heterotrophic anaerobic cells—fermentation	217
9. The fate of the energy coming from the fuel: A first view on the part played by ATP	217
10. The machinery of cells	218
32. Adenosine Triphosphate, Adenosine Diphosphate, Monophosphate and Derivatives NAD⁺: Some Physico-Chemical Properties	220
1. Chemical structure of adenosine triphosphoric acid and derivatives	220
2. Some physico-chemical properties of adenosine triphosphoric acid and derivatives	223
3. The reaction of hydrolysis of ATP	225
4. The reaction of hydrolysis of ATP and complexation with Mg ²⁺ ions	227
5. Coenzymes NAD ⁺ , NADP ⁺ , NADPH	228
33. The Transfer of Chemical Energy with the Aid of ATP	230
1. Come back to the free energy of hydrolysis of ATP	230
2. Gibbs energies of hydrolysis of some phosphorylated compounds	231
3. An unfortunate qualifier	232
4. ATP provider of energy by groups transfers	232

5. An example of utilization of ATP free energy to do chemical work	233
6. Steps in the extraction of energy from foodstuffs	233
34. Glycolysis and Fermentation	235
1. An overview of the glycolytic chain	235
2. Some comments above the different steps of the chain	235
3. Fermentation	242
4. Glycolysis and fermentation	243
5. A balance-sheet of glycolysis	243
6. Fructose and galactose can enter into the glycolytic chain	244
35. The Citric Acid Cycle	247
1. General features of the cycle	247
2. Formation of acetylcoenzyme A by starting from pyruvate	247
3. The Krebs's cycle	248
4. Some comments	248
5. The balance-sheet of the citric acid cycle	253
6. Slightly more about the citric acid cycle	254
36. Oxidative Phosphorylation—Photosynthesis	255
1. Brief overview	255
2. Redox potentials and oxidative phosphorylation	255
3. The respiratory chain—the global Gibbs energy	256
4. The enzymatic complexes and the mobile carriers of electrons involved in the respiratory chain	257
5. The last step of the respiratory chain	258
6. The different steps of the respiratory chain	258
7. Some comments about the different steps of the respiratory chain	259
8. The balance-sheet of the complete glucose oxidation	262
9. Coupling oxidation and phosphorylation	262
10. Vectorial reaction	263
11. Photosynthesis	263
37. The Pentose Phosphates Pathway—Glucogenesis	266
1. An overview	266
2. The pentose-phosphates pathway	267
3. Neoglucogenesis	271
38. The Chemical Work of Biosynthesis	274
1. Some generalities about biosynthesis	274
2. Thermodynamic aspects of biosynthesis	275
3. Biosynthetic reactions resulting from a loss of a pyrophosphate rest	276
4. Channeling of ATP energy via other triphosphates	277
5. Biosynthesis of polysaccharides	280

6. Biosynthesis of lipids	282
7. Biosynthesis of amino-acids	284
8. Super structures—supramolecular chemistry	286
39. Lipids and Amino-Acids as Fuel	287
1. Fatty acids as fuel	287
2. Amino-acids as fuel	290
40. Active Transport and Electrical Work	295
1. Structure and properties of cell membranes	295
2. Solute transports across membranes	296
3. The osmotic work	296
4. Transcellular active transport	298
5. Intracellular active transport	298
6. Action potentials	299
7. Contraction and motion	300
41. The Molecular Basis of the Informational System—The Replication of DNA—The Transcription to mRNA—Protein Biosynthesis	302
1. Structure of desoxyribonucleic acid	302
2. RNA	305
3. Encoding	305
4. The replication of DNA	306
5. The transcription to mRNA	306
6. Protein biosynthesis	307
42. Biological Information	311
1. Information theory	311
2. A particular interesting example of information of high quality	312
3. Some theoretical points of the information theory	312
4. Entropy and information (following)—an interesting thought experiment: The Maxwell's demon experiment	313

Appendices

I. Physico-Chemical and Biochemical Appendices	315
I-1 Calculations of the molality and of the molarity of a solute from its molar fraction	315
I-2 Weak bonds	316
I-3 Steady state—Rate determining state	318
I-4 Some recalls concerning the optical activity and chirality	319
I-5 Optical activity and carbohydrates	326
I-6 Determination of the different Gibbs energies involved during the hydrolysis of ATP when several equilibria simultaneously occur	329
I-7 The vectorial action of enzymes	331

I-8	Gibbs energies of formation of some biochemical compounds	331
I-9	Standard reduction potentials of some biologically important half redox reactions	332
I-10	Usual amino acids encountered in proteins	332
II.	Mathematical Appendices	333
II-1	Derivative of a function	333
II-2	One meaning of an integral	334
II-3	Gradient (of concentration)	335
II-4	Partial derivatives—Total differential—State functions and total exact differentials	336
II-5	Handling the internal energy and other state functions of thermodynamics depending on two independent variables	338
II-6	Schwartz's theorem	339
	<i>General Bibliography</i>	340
	<i>Index</i>	341
