Thermodynamics

Fundamental Principles and Applications

Contents

Part I Formulation of the Theory

1	Macroscopic Systems and Empirical Temperature	3
1.1	Macroscopic Systems	3
1.2	Macroscopic Observer	4
1.3	Thermodynamic State	6
1.4	The Concept of Empirical Temperature	6
1.5	The Perception of Hotness and Coldness	6
1.6	The Empirical Temperature and the Zeroth Principle of Thermodynamics	8
	1.6.1 Equilibrium State	8
	1.6.2 The Zeroth Principle	9
2	The First Principle of Thermodynamics	13
2.1	Introduction	13
2.2	Closed Systems	14
2.3	Adiabatic Walls and Adiabatic Transformations	14
2.4	The Definition of Energy	15
	2.4.1 Energy of Familiar Adiabatic Systems	16
2.5	Definition of Heat (Quantity of)	21
2.6	Infinitesimal Transformations	22
2.7	Formulation of the First Principle of Thermodynamics	23
3	The Second Principle of Thermodynamics	25
3.1	Introduction	25
3.2	Natural and Unnatural Processes	27
3.3	Quasi-static Processes	28
3.4	Reversible Processes	29
3.5	Formulation of the Second Principle: Definition of S and T	29
	3.5.1 State Functions	30
	3.5.2 Extensive and Intensive Quantities	31

3.5.3	Measuring S	32
3.5.4	The Absolute, or Thermodynamic, Temperature T	33
3.6	Discontinuous Systems Approximation	33
3.6.1	Resume	35
3.7	On the Predictive Power of Thermodynamics	36
3.8	Efficiency of Thermal Engines	38
3.9	Carnot Cycles	41
3.10	On the Determination of the New Scale of Temperature T	44
3.11	The Carnot Engine and Endoreversible Engines	44
3.12	Coefficient of Performance (COP)	47
3.12.1	Refrigerator	48
3.12.2	Heat Pump	48
3.13	Availability and Maximum Work	50
	Problems	52
4	The Fundamental Relation and the Thermodynamic Potentials	55
4.1	Introduction	55
4.2	The Equilibrium State Postulate for Closed Systems with No Chemical Reactions	56
4.2.1	Simple Systems	58
4.3	The Fundamental Relation	59
4.3.1	The General Case for Open Systems with Variable Composition: The Chemical Potential	61
4.3.2	Other Thermodynamic Potentials	63
4.3.3	The Free Energy and Isothermal Processes in Closed Systems	64
4.3.4	The Enthalpy and Isobaric Processes	68
4.3.5	The Gibbs Potential and Isothermal and Isobaric Processes	69
4.3.6	The Stability Problem in a Thermodynamical System	71
4.3.7	Adiabatic Systems	73
4.3.8	Systems at Constant Temperature	74
4.3.9	Systems at Constant Entropy	75
4.3.10	The Isothermal Compressibility	76
4.3.11	The Dependence of Entropy on Temperature	78
4.3.12	Other Consequences from the Stability Conditions	79
5	Maxwell Relations	81
5.1	Introduction	81
5.2	Some Properties of Materials	82
5.3	The Volume and Pressure Dependence of Entropy	84

5.4	The Heat Capacities and the Temperature Dependence of Entropy	84
5.4.1	The Heat Capacity at Constant Pressure	85
5.4.2	The Heat Capacity at Constant Volume	85
5.4.3	The Relation Between C_p and C_V	86
5.4.4	The Adiabatic Compressibility Coefficient	87
5.4.5	The Equations of the Adiabatic Transformations	88
5.5	Concluding Remarks and the Role of C_p , α , χ_T	88
5.5.1	Isothermal Processes	90
5.5.2	Free Expansion	90
5.5.3	Pressure Drop in Free Expansion	91
5.5.4	Temperature–Pressure Variations in Adiabatic Transformations	92
5.5.5	Temperature–Volume Variations in Adiabatic Transformations	93
	Problems	93

Part II Applications

6	General Properties of Gaseous Systems	97
6.1	Isothermal Behavior of Gases	97
6.2	The First Virial Coefficient for Gases	98
6.2.1	The Joule–Thomson Experiment	98
6.2.2	Some Thermodynamic Potentials for Gases	100
6.2.3	Calorimetric Measurements for the Determination of the First Virial Coefficient	101
6.3	Definition of the Temperature Scale by Means of Gases	102
6.3.1	Other Determinations of the Temperature Scale	104
6.4	The Universal Constant of Gases	105
6.5	The Joule–Thomson Coefficient	105
6.6	The Inversion Curve	107
6.6.1	Liquefaction of Gases and the Attainability of Low Temperatures	108
6.7	A Simple Approximation of the Isothermal Behavior of Gases	110
6.8	The Chemical Potential in Diluted Gases	111
6.9	Molar Heat at Constant Volume for Dilute Gases	113
6.9.1	Microscopic Degrees of Freedom	113
6.9.2	Energy Equipartition	116
6.9.3	On the Temperature Dependence of Molar Heats	117
7	Phase Transitions	121
7.1	Phases Equilibrium	121
7.2	Latent Heat	122

7.2.1	Liquid–Vapor Equilibrium	123
7.2.2	Equilibrium Between Condensed Phases: Solid–Liquid	124
7.2.3	Solid–Vapor Equilibrium	125
7.3	Triple Point	125
7.4	Phase Diagrams	126
7.4.1	(p, V) Diagrams	128
7.4.2	Molar Heat at Equilibrium	130
7.4.3	Temperature Dependence of the Latent Heats	132
7.5	Continuity of States	133
7.6	Continuous-Phase Transitions	133
7.6.1	Differences Between Continuous- and Discontinuous-Phase Transitions	136
7.7	Exercises	137
8	van der Waals Equation	139
8.1	Introduction	139
8.2	A Simple Modification to the Equation of State for Ideal Gases	139
8.3	Successes and Failures of the van der Waals Equation	144
8.3.1	van der Waals Equation and the Boyle Temperature	145
8.3.2	The Critical Point	146
8.3.3	The Dependence of the Energy of a van der Waals Gas on Volume	148
8.3.4	The Coefficient of Thermal Expansion for a van der Waals Gas	149
8.3.5	The Molar Heats at Constant Volume and at Constant Pressure in a van der Waals Gas	149
8.3.6	The Joule–Thomson Coefficient and the Inversion Curve for a van der Waals Gas	150
8.3.7	Determination of Vapor Pressure from the van der Waals Equation	151
8.3.8	Free Energy in a van der Waals Gas	153
8.4	The Law of Corresponding States	155
8.4.1	Corresponding States for the Second Virial Coefficient	156
8.4.2	The Compressibility Factor and the Generalized Compressibility Chart	156
8.4.3	Vapor Pressure and Latent Heat of Vaporization	160

8.4.4	Triple Point and the Law of Corresponding States	162
8.4.5	The Inversion Curve and the Law of Corresponding States	162
8.4.6	The Law of Corresponding States and the van der Waals's Equation	164
8.5	Power Laws at the Critical Point in a van der Waals Gas	165
8.6	Exercises	167
9	Surface Systems	169
9.1	Introduction	169
9.2	Surface Tension	170
9.3	Properties of Surface Layers	172
9.3.1	Stability of Equilibrium States	175
9.4	Interfaces at the Contact Between Two Phases in Equilibrium	176
9.5	Curvature Effect on Vapor Pressure: Kelvin's Relation	178
9.6	Nucleation Processes and Metastability in Supersaturated Vapor	183
9.6.1	Spinodal Decomposition	186
9.6.2	Temperature Dependence	187
9.6.3	Surface Tension and the Law of Corresponding States	189
9.6.4	Interfaces at Contact Between Three Phases in Equilibrium	189
10	Electrostatic Field	193
10.1	Introduction	193
10.2	The Response of Matter	194
10.3	The Dielectric Constant	196
10.4	Thermodynamic Potentials for Linear Dielectrics	196
10.4.1	Thermodynamic Potentials for Linear Dielectrics Without Electrostriction	197
10.5	Dielectric Constant for Ideal Gases	200
11	Magnetic Field	207
11.1	Introduction	207
11.2	Electric Work, Magnetic Work, and Radiation	208
11.3	Constitutive Relations	210
11.3.1	Uniform Medium	211
11.4	Diamagnetic Materials	213
11.5	Paramagnetic Materials	213
11.5.1	Long, Rectilinear, and Homogeneous Solenoid	214

11.6	Thermodynamic Potentials in the Presence of Magnetostatic Fields	215
11.6.1	Expression of the Thermodynamic Potentials	215
11.6.2	Linear Media	216
11.7	Adiabatic Demagnetization	216
11.8	Ferromagnetic Materials	217
12	Thermodynamics of Radiation	219
12.1	Introduction	219
12.2	Kirchhoff's Law	220
12.2.1	Absorptivity of Material Bodies	220
12.2.2	Emissivity of Material Bodies	220
12.2.3	Black Body	222
12.2.4	Kirchhoff's Law for the Emissivity of a Black Body	224
12.2.5	One Fundamental Consequence of Kirchhoff's Law	225
12.2.6	Extended Form of the Kirchhoff's Law	227
12.2.7	Emittance	228
12.2.8	Radiation Energy Density and Emissivity	229
12.3	Wien's Law	231
12.3.1	Wien's Law According to Wien	232
12.3.2	Wien's Law and Relativity	232
12.3.3	Some Consequences of the Wien's Law	234
12.4	Thermodynamic Potentials for Radiation	237
12.5	Thermodynamical Processes for Radiation	239
12.5.1	Isothermal Processes	240
12.5.2	Adiabatic Processes	240
12.5.3	Isochoric Transformations (Constant Volume)	241
12.5.4	Free Expansion	242
12.6	Planck and the Problem of Black-Body Radiation	243
12.6.1	The Situation at the End of the Nineteenth Century and the Black-Body Radiation	244
12.6.2	Planck and the Problem of Matter-Radiation Interaction	244
12.6.3	The Planck Solution (Through Thermodynamics)	246
12.6.4	The Dawn of Quantum Physics	248
12.7	Exercises	249
13	Third Law of Thermodynamics	251
13.1	The Third Law of Thermodynamics	251
13.1.1	Formulation According to Nernst and Planck	252
13.1.2	Some Observational Consequences	252

Part III Irreversible Processes

14 Irreversible Processes: Fundamentals	261
14.1 Introduction	261
14.1.1 Rephrasing the First Principle	262
14.2 Heat Exchange	263
14.3 Chemical Reactions	265
14.3.1 The Rate of Reaction	266
14.3.2 Entropy Production and the Chemical Affinity	267
14.4 Open Systems	271
14.5 Electrochemical Reactions	275
14.6 Generalized Fluxes and Forces	277
14.6.1 Determination of Generalized Fluxes and Forces	277
14.7 Onsager Relations	281
14.7.1 The Curie Symmetry Principle	284
14.8 The Approximation of Linearity	285
14.8.1 Chemical Affinity	285
14.8.2 Reaction Rate	286
14.8.3 Linear Relations Between Rates and Affinities	288
14.8.4 Relaxation Time for a Chemical Reaction	290
15 Irreversible Processes: Applications	293
15.1 Introduction	293
15.1.1 Thermomechanical Effects	293
15.1.2 Knudsen Gases	295
15.1.3 Electrokinetic Effects	305
15.2 Stationary States	308
15.2.1 Configurations of Minimal Entropy Production	310
15.2.2 Determination of the Stationary State	313
15.2.3 Stability of Stationary States and the Principles of Le Chatelier and of Le Chatelier–Braun	313
15.3 Fluctuations	320
15.3.1 Theory of Fluctuations in a Isolated System	323
15.3.2 Fluctuations Distribution Function	326
15.3.3 Mean Values and Correlations	326
15.3.4 Onsager Relations and the Decay of Fluctuations in Isolated Systems	328
16 Thermodynamics of Continua	333
16.1 Introduction	333
16.2 Definition of System	334
16.3 Mass Conservation	335
16.4 Equation of Motion	338
16.5 The Equation for Energy	339

16.6	The Equation for Entropy	342
16.6.1	Entropy Balance in Continuous Systems	343
16.6.2	The Entropy Production	346
16.6.3	Mechanical Equilibrium	347
16.6.4	The Einstein Relation Between Mobility and Diffusion Coefficient	348
16.7	Thermoelectric Phenomena	351
16.7.1	Seebeck Effect—Thermoelectric Power	352
16.7.2	Peltier Coefficient—Phenomenology	353
16.7.3	Thomson Effect—Phenomenology	354
16.7.4	Peltier Effect—Explanation	360
16.7.5	Thomson Effect	361
16.7.6	Galvanomagnetic and Thermomagnetic Effects	362
16.8	Thermodiffusion Processes	363
16.8.1	Binary Systems	366
16.8.2	Thermodiffusion	367
16.8.3	Dufour Effect	369
16.9	Appendix—The Gibbs–Duhem Relation	370

Part IV Thermodynamics and Information

17	Introduction to the Role of Information in Physics	375
17.1	The Maxwell’s Paradox	375
17.2	The Leo Szilard’s Article in 1929	376
17.3	The Observer Creates Information	379
17.4	The Solution of Maxwell–Szilard Paradox	380
17.5	Landauer Principle	381
17.6	On the Separation Observer–Observed	382
17.6.1	Information as a Physical Quantity Which Acquires a Physical Reality	382
17.6.2	New Perspectives: The Physical Entropy According to Zurek	390
	Appendix A: Math Tools	393
	Appendix B: Pressure Exerted by a Particle Gas	399
	Solutions to the Problems	405
	References	423
	Index	425
