MITTEILUNGEN
HEFT 27

**Experimental analysis of the
evolution of fabric in granular
soils upon monotonic loading and
load reversals**

**Experimentelle Untersuchung der
Strukturentwicklung in
granularen Böden bei monotoner
Belastung und Lastwechseln**

von
Max Wiebicke

DRESDEN 2020

Contents

List of Abbreviations and Symbols	1
I Introduction and state of the art	3
1 Motivation	5
1.1 Modelling soil behaviour	7
1.2 Fabric	10
1.2.1 What is fabric?	12
1.2.2 Statistical description of fabric	14
1.3 How could information on fabric be used?	15
1.4 Structure of the thesis	17
2 History of accessing fabric information	19
2.1 Experimental studies	19
2.2 Numerical approaches	23
3 X-ray micro tomography for measuring the fabric of granular materials	31
3.1 Image processing of tomographies	37
3.2 Literature study on the metrology of granular fabric	40
3.3 Advances in soil mechanics using x-ray μ CT	44
II Contact fabric evolution in monotonic and cyclic experiments	47
4 Metrology of contact and particle fabric	49
4.1 Metrology of individual contacts	51
4.1.1 Contact detection	55

4.1.2	Contact orientations	64
4.2	Metrology of contact orientations in assemblies	71
4.3	Metrology of particle orientations	83
4.4	Summary of the metrological analysis	87
5	Experimental work	91
5.1	Monotonic triaxial compression tests	92
5.2	Cyclic experiments in compression	102
5.2.1	Oedometric compression test	102
5.2.2	Triaxial compression tests	108
5.3	Summary of the experimental work	118
6	Final thoughts	121
6.1	Image analysis	122
6.2	Experimental insight	123
6.2.1	Incremental response upon load reversal	125
6.3	Further work and outlook	129
6.4	Conclusions	131
III	Technical details	135
7	General topics	137
7.1	Fabric tensors	137
7.2	Graphical representations	139
7.2.1	Plotting of individual orientations	139
7.2.2	Plotting of fabric tensors	141
7.3	Kalisphera	143
7.4	Towards realistic, synthetic images	143
7.4.1	How to incorporate blur and noise in the synthetic images	144
7.4.2	Image properties of real x-ray tomographies	145
8	Metrology of individual contacts	151
8.1	Study on synthetic images	151
8.1.1	Reference configurations	151
8.1.2	Creation of a synthetic image of two touching spheres	152
8.1.3	Contact detection	153
8.1.4	Influence of the image grid on contact detection . . .	158
8.1.5	Locally adaptive thresholding	160

8.1.6	Contact orientations	163
8.1.7	Using levels set for contact orientations	166
8.2	Study on high resolution tomographies	169
8.2.1	Acquisition of high resolution tomographies	169
8.2.2	Treatment of the high resolution tomographies	170
8.2.3	Contact detection	172
8.2.4	Contact orientations	176
9	Image analysis toolbox	179
9.1	Standard image processing	180
9.2	Detection of contacts in assemblies	185
9.3	Determination of contact orientations in assemblies	187
9.4	Some tricks for the analysis of real tomographies	190
9.4.1	Dealing with noise patches	190
9.4.2	Dealing with over-segmentation	191
9.4.3	Choosing markers for the random walker	192
9.5	Determination of the coordination number	193
9.6	Calculation of the void ratio	195
9.6.1	Classifying the determined void ratios	196
10	Metrological study on assemblies	199
10.1	Study on synthetic images	199
10.1.1	Numerical simulations as a reference	199
10.1.2	Transforming numerical assemblies into images	202
10.1.3	Contact detection in assemblies	206
10.1.4	Contact orientations in assemblies	207
10.2	An experiment on glass beads	213
10.2.1	Image processing and problems	214
10.2.2	Contact fabric evolution	218
10.3	Error propagation	221
11	Metrology of particle orientations	225
11.1	Studying particle orientations with an individual Hostun grain scan	225
11.1.1	Procedure to study the accuracy	225
11.2	Study on many Hostun sand particles	228
12	Experimental campaign	233
12.1	Materials used in this work	233
12.2	Subset analysis on existing experiments	234

12.2.1	Image analysis	235
12.2.2	Individual contact orientations	239
12.2.3	Evolution of the fabric tensor	242
12.2.4	Importance of considering changes in an image series	243
12.3	Oedometric compression test	246
12.3.1	Experimental set-up and macroscopic response	246
12.3.2	Image processing	248
12.3.3	Contact fabric evolution in an observation window	250
12.3.4	A simple DEM simulation of an oedometric compression test	252
12.4	Triaxial compression test	253
12.4.1	Experimental set-up and macroscopic response	253
12.4.2	Image processing	257
12.4.3	16-bit versus 8-bit analysis	258
12.4.4	Reproducibility of the tomographies and the image processing	260
12.4.5	Initial contact fabric	261
12.4.6	Response of the contact fabric	262
12.4.7	Fabric analysis of observation windows in the triaxial compression specimens	266
12.4.8	Response of the particle fabric	269
12.5	Cyclic triaxial compression test on lentils	273
12.5.1	Image processing	274
12.5.2	Fabric response	275
	Bibliography	279
