

**An adjoint model for the determination of the mean
oceanic circulation, air-sea fluxes und mixing coefficients**

**Bestimmung von mittlerer ozeanischer Zirkulation,
Oberflächenflüssen und Mischungskoeffizienten mittels
der Adjunktiven Methode**

Reiner Schlitzer

Contents

Zusammenfassung	ii
Summary	iv
1 Introduction	1
2 Hydrographic Station Data	7
2.1 Spatial and Temporal Data Coverage	7
2.2 Use of the Hydrographic Data in the Model	10
3 Model Setup and Strategy	19
3.1 Model Grid and Geometry	19
3.2 Parameters and Model Equations	20
3.3 Clusters	22
3.4 Mixing Tensor	23
3.5 Cost Function	25
3.6 Adjoint Model	28
4 Initialization of Model Parameters	31
4.1 Pre-optimization	31
4.2 Iterative Procedure	32
4.3 “Independent Layer” Approach	35
5 Model Calculations and Results	39
5.1 Overview of Numerical Experiments	39
5.2 Calculations with the Upwind Differencing Scheme (UPW)	40
5.3 Calculations with the Centered-in-Space Differencing Scheme (CS)	68
5.4 Diapycnal Mixing Linked to Stability (CS-N)	73
5.5 Adding Heat Flux Constraints (CS-H)	76
6 Discussion and Conclusions	87
Acknowledgments	95
References	97
